NEW QUESTION 19

HOTSPOT - (Topic 6)

You are the system administrator of a Dynamics 365 Finance system. You review the configuration of batch jobs in the system.

You need to complete the configuration to meet the requirements.

Which features should you configure? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Requirement	Feature
System maintenance jobs must run outside business hours.	<input type="checkbox"/> active periods <input type="checkbox"/> system job parameters <input type="checkbox"/> working time templates
Define the processing order of batch jobs.	<input type="checkbox"/> active periods <input type="checkbox"/> scheduling priority <input type="checkbox"/> throttling priority mapping
Inform the IT support team when a critical job fails.	<input type="checkbox"/> alerts <input type="checkbox"/> database logging <input type="checkbox"/> email broadcast

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Box 1: active periods Active batch periods

With the release of Platform update 21, an additional level of control over when batch jobs execute is now available. Previously, it was only possible to schedule a batch job to execute every hour for a specified number of hours or until a given date. Administrators can now provide information for an additional active period, such as in the following scenarios:

? Specifying time ranges during which jobs within a batch group can start execution.

? Selecting to run batch jobs outside of office hours only.

? Setting the recurrence for anytime within the active period. For example, you administrator might select to run the batch jobs every hour, but only between the hours of 6:00 PM and 8:00 AM.

Box 2: scheduling priority

In Platform update 31, you can turn on the Batch priority-based scheduling feature in Feature management. Priority-based scheduling decouples batch groups from the batch server and allows you to define priorities for batch groups. It is no longer necessary to assign batch jobs to batch servers. Instead, relative scheduling priorities based on business requirements are used to determine the order in which tasks are run across available batch servers.

Box 3: alerts

Alerts form a notification system for critical events in finance and operations. You can use alerts to stay informed about events that you want to track during the workday. You can set up a set of alert rules so that you're alerted when a batch job ends, ends in error, or is canceled. You can select whether the alerts are emailed to you or appear as notifications in the Action center. Alerts can be set up per batch job and per user.

NEW QUESTION 128

HOTSPOT - (Topic 6)

You are implementing Dynamics 365 Supply Chain Management. You use the Regression Suite Automation Tool (RSAT) to test the solution.

You are planning to create the following test cases:

- Create a new purchase order
- Receipt the purchase order.

You need to complete the configuration to chain the test cases together.

How should you complete the configuration? To answer, select the appropriate configuration in the answer area.

NOTE: Each correct selection is worth one point.

Requirement	Action
Create a variable for the purchase order number when creating the first task recording.	<ul style="list-style-type: none"> Use the Copy option. Use the Validate option. Add a developer placeholder. Add an info step.
Configure the second task recording to use the variable.	<ul style="list-style-type: none"> Replace the hardcoded value with the variable name. Create a derived test case. Add a message validation using the variable name. Enable Use operators for validation.

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

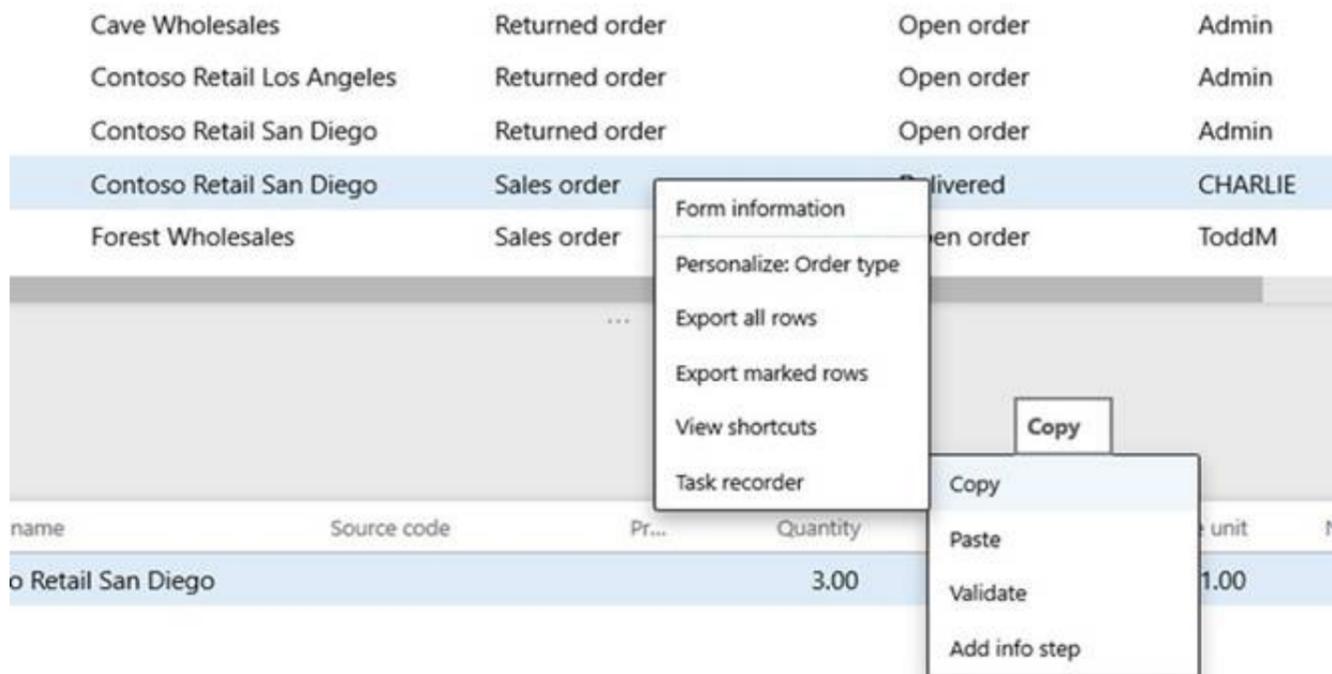

Box 1: Use the Copy option

Copy variables to chain test cases

One of the key features of the Regression Suite Automation Tool is the chaining of test cases, that is, the ability of a test to pass values to other tests. Test cases

are executed according to their defined order in the Azure DevOps test plan, which can also be updated in the test tool itself. It is important to correctly order the tests if you want to pass variables from one test case to the other.

To save the value of a variable while recording the test in Task Recorder, right-click the field and select Task recorder > Copy, as shown in the following image. Copying will save the variable in the recording file. This variable can be used in subsequent tests.

Box 2: Create a derived test case Derived test cases

The Regression suite automation tool (RSAT) lets you use the same task recording with multiple test cases, so that you can run a task with different data configurations. Select a test case in the Regression suite automation tool and then select New > Create Derived Test Case. This creates a child test case in Azure DevOps. The resulting derived test case is linked to its parent test case in Azure DevOps. It has an Excel parameters file attached but no recording file. The derived test case will appear in the Regression suite automation tool grid under the same test suite with the Derived column selected. By default, derived test cases are named after their parent test case with a numeric suffix.
