NEW QUESTION 5
- (Exam Topic 2)
Which report should the New York office auditors view?

A. DLP policy matches
B. DLP false positives and overrides
C. DLP incidents
D. Top Senders and Recipients

Answer: C

Explanation:
References:
https://docs.microsoft.com/en-us/office365/securitycompliance/data-loss-prevention-policies
This report also shows policy matches over time, like the policy matches report. However, the policy matches report shows matches at a rule level; for example, if an email matched three different rules, the policy matches report shows three different line items. By contrast, the incidents report shows matches at an item level; for example, if an email matched three different rules, the incidents report shows a single line item for that piece of content. Because the report counts are aggregated differently, the policy matches report is better for identifying matches with specific rules and fine tuning DLP policies. The incidents report is better for identifying specific pieces of content that are problematic for your DLP policies.

NEW QUESTION 196
- (Exam Topic 4)

You have a Microsoft 365 subscription.
From the subscription, you perform an audit log search, and you download all the results. You plan to review the audit log data by using Microsoft Excel.
You need to ensure that each audited property appears in a separate Excel column. What should you do first?

A. From Power Query Editor, transform the JSON data.
B. Format the Operations column by using conditional formatting.
C. Format the AuditData column by using conditional formatting.
D. From Power Query Editor, transform the XML data.

Answer: A

Explanation:
After you search the Office 365 audit log and download the search results to a CSV file, the file contains a column named AuditData, which contains additional information about each event. The data in this column is formatted as a JSON object, which contains multiple properties that are configured as property:value pairs separated by commas. You can use the JSON transform feature in the Power Query Editor in Excel to split each property in the JSON object in the AuditData column into multiple columns so that each property has its own column. This lets you sort and filter on one or more of these properties
