You are configuring a recurring integration in Dynamics 365 Supply Chain Management. The released products entity is enabled for change tracking.
The integration must meet the following requirements:
• Export released product information using the recurring integrations capability within the data management framework.
• Export only released products assigned to item group A.

Which four actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

A. Mastered
B. Not Mastered

Answer: A

Explanation:
Step 1: Configure an Export data project
Set up a data project and recurring data jobs Create a data project
? On the main dashboard, select the Data management tile to open the Data
management workspace.
? Select the Import or Export tile to create a new data project.

? Enter a valid job name, data source, and entity name.

? Upload a data file for one or more entities. Make sure that each entity is added, and Note: You can select each entity data card to set up, review, or modify field maps, and to set up XSLT-based transforms that must be applied to inbound data. For export data projects, the entity card also shows a filter link, so that you can set up filters to filter data. Currently, all recurring data jobs in a data project use the same filter.that no errors occur.

? Select Save.

Step 2: Configure the filter criteria for item group A. Export only released products assigned to item group A.

Step 3: Create a recurring data job and configure processing recurrent to start immediately. Create a recurring data job

? On the Data project page, select Create recurring data job.

? Enter a valid name and a description for the recurring data job.

? On the Set up authorization policy tab, enter the application ID that was generated for your application, and mark it as enabled.

? Expand Advanced options tab, and specify either File or Data package.

File – Your external integration will push individual files so that they can be processed via this recurring data job. In this case, the format of the file that is expected is the same as the format that was specified when the entity was added to the data project.

Data package – You can push only data package files for processing. A data package is a new format that lets you submit multiple data files as a single unit that can be used in integration jobs.

Process messages in order – You can enable this option to force sequential processing of incoming files in an import scenario. This option is only applicable to files and not data packages.

? Select Set processing recurrence, and then, in the Define recurrence dialog box, set up a valid recurrence for your data job.

? Optional: Select Set monitoring recurrence, and set up a monitoring recurrence.

? Select OK, and then select Yes in the confirmation message box.

Step 4: Add the Released Products entity with a default refresh type set to Incremental push only.

Export only the released product, which has been amended since the previous export.

Export either all the records (full push) or only the records that have changed or been deleted (incremental push).

Box 1: Trace parser
You can diagnose issues and analyze performance by using Trace parser.
You can use the Trace parser to consume traces and analyze performance in your deployment. You can use the Trace Parser to find and diagnose various types of errors. You can also use the tool to visualize execution of X++ methods, as well as the execution call tree.
Box 2: Review X++ calls.
Trace Parser can help identify performance issues including long-running X++ methods, time-consuming SQL queries, or client server calls. Trace Parser

consolidates information
from multiple sources, such as remote procedure calls (RPCs) and Microsoft SQL Server, to provide an integrated view of application performance for a process. Trace Parser not only measures code execution, but also provides information about database execution times and may indicate performance issues due to caching.

Answer: A

Explanation:
Toolkit Overview: RSAT Integration Testing
RSAT (regression suite automation tool) will get a new improvement where our RSAT tool should be able to support an end-to-end integration scenario. It will allow run sessions for third-party applications that run before or after Finance and Supply Chain Management is run. Essentially, you will be able to trigger an integration in some portal and then verify the outcomes in Finance and Supply Chain Management. It's the same as if you were doing with the C# NUnit framework and selenium WebDrivers, although, in this case, you likely won't require coding. The main idea is to be able to do integration scenario testing and be able to do that without developer help. Since development can be expensive it's not something that customers really aim to do. We will get this feature in general availability and in public preview within the next few months, so stay tuned and follow the latest Microsoft improvements so you don't miss out!

Explanation:
With the different bike configurations, Adventure Works Cycles would like to use a single business process but test against 10 different data configurations to streamline errors against data variations in the manufacturing process.
Derived test cases
The Regression suite automation tool (RSAT) lets you use the same task recording with multiple test cases, so that you can run a task with different data configurations. Select a test case in the Regression suite automation tool and then select New > Create Derived Test Case. This creates a child test case in Azure DevOps. The resulting derived test case is linked to its parent test case in Azure DevOps. It has an Excel parameters file attached but no recording file. The derived test case will appear in the Regression suite automation tool grid under the same test suite with the Derived column selected. By default, derived test cases are named after their parent test case with a numeric suffix.
