

Microsoft

Exam Questions AZ-104

Microsoft Azure Administrator

NEW QUESTION 1

HOTSPOT - (Topic 5)
 You have an Azure virtual machine named VM1 that connects to a virtual network named VNet1. VM1 has the following configurations:
 ? Subnet: 10.0.0.0/24
 ? Availability set: AVSet
 ? Network security group (NSG): None
 ? Private IP address: 10.0.0.4 (dynamic)
 ? Public IP address: 40.90.219.6 (dynamic)
 You deploy a standard, Internet-facing load balancer named slb1. You need to configure slb1 to allow connectivity to VM1.
 Which changes should you apply to VM1 as you configure slb1? To answer, select the appropriate options in the answer area.
 NOTE: Each correct selection is worth one point.

Before you create a backend pool on slb1, you must:

Create and assign an NSG to VM1

Remove the public IP address from VM1

Change the private IP address of VM1 to static

Before you can connect to VM1 from slb1, you must:

Create and configure an NSG

Remove the public IP address from VM1

Change the private IP address of VM1 to static

Answer:

Before you create a backend pool on slb1, you must:

Create and assign an NSG to VM1

Remove the public IP address from VM1

Change the private IP address of VM1 to static

Before you can connect to VM1 from slb1, you must:

Create and configure an NSG

Remove the public IP address from VM1

Change the private IP address of VM1 to static

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:
 Box 1: Remove the public IP address from VM1
 If the Public IP on VM1 is set to Dynamic, that means it is a Public IP with Basic SKU because Public IPs with Standard SKU have Static assignments by default, that cannot be changed. We cannot associate Basic SKUs IPs with Standard SKUs LBs. One cannot create a backend SLB pool if the VM to be associated has a Public IP. For Private IP it doesn't matter weather it is dynamic or static, still we can add the such VM into the SLB backend pool.
 Box 2: Create and configure an NSG
 Standard Load Balancer is built on the zero trust network security model at its core. Standard Load Balancer secure by default and is part of your virtual network. The virtual network is a private and isolated network. This means Standard Load Balancers and Standard Public IP addresses are closed to inbound flows unless opened by Network Security Groups. NSGs are used to explicitly permit allowed traffic. If you do not have an NSG on a subnet or NIC of your virtual machine resource, traffic is not allowed to reach this resource. To learn more about NSGs and how to apply them for your scenario, see Network Security Groups. Basic Load Balancer is open to the internet by default.

NEW QUESTION 2

HOTSPOT - (Topic 5)
 You have an Azure subscription that contains the vaults shown in the following table.

| Name | Type |
|-----------|-------------------------|
| Backup1 | Backup vault |
| Recovery1 | Recovery Services vault |

You create a storage account that contains the resources shown in the following table.

| Name | Type |
|--------|----------------|
| cont1 | Blob container |
| share1 | File share |

To which vault can you back up cont1 and share1? To answer, select the appropriate options in the answer area. NOTE: Each correct answer is worth one point.

Answer Area

cont1:

Backup1 only

Backup1 only

Recovery1 only

Backup1 or Recovery1

Cannot be backed up to Backup1 or Recovery1

share1:

Recovery1 only

Backup1 only

Recovery1 only

Backup1 or Recovery1

Cannot be backed up to Backup1 or Recovery1

- A. Mastered
B. Not Mastered

Answer: A

Explanation:
Answer Area

cont1:

Backup1 only

Backup1 only

Recovery1 only

Backup1 or Recovery1

Cannot be backed up to Backup1 or Recovery1

share1:

Recovery1 only

Backup1 only

Recovery1 only

Backup1 or Recovery1

Cannot be backed up to Backup1 or Recovery1

NEW QUESTION 3

HOTSPOT - (Topic 5)

You have an Azure subscription that contains the container images shown in the following table.

| Name | Operating system |
|--------|------------------|
| Image1 | Windows Server |
| Image2 | Linux |

You plan to use the following services:

- Azure Container Instances
- Azure Container Apps
- Azure App Service

In which services can you run the images? To answer, select the options in the answer area.

NOTE: Each correct answer is worth one point.

Answer Area

Image1:

Azure Container Instances only

Azure Container Apps only

Azure Container Instances and App Services only

Azure Container Apps and App Services only

Azure Container Instances, Azure Container Apps, and App Services

Image2:

Azure Container Instances only

Azure Container Apps only

Azure Container Instances and App Services only

Azure Container Apps and App Services only

Azure Container Instances, Azure Container Apps, and App Services

- A. Mastered
B. Not Mastered

Answer: A

Explanation:

Image 1: Azure Container Apps only.image 2: Azure Container Instances, Azure Container Apps, and App Services.

The images you have in your Azure subscription are different types of container images that can run on different Azure services. A container image is a package of software that includes everything needed to run an application, such as code, libraries, dependencies, and configuration files. Container images are portable and consistent across different environments, such as development, testing, and production.

Azure Container Instances is a service that allows you to run containers directly on the Azure cloud, without having to manage any infrastructure or orchestrators.

You can use Azure Container Instances to run any container image that is compatible with the Docker image format and follows the Open Container Initiative (OCI) specification. You can also run Windows or Linux containers on Azure Container Instances.

Azure Container Apps is a service that allows you to build and deploy cloud-native applications and microservices using serverless containers. You can use Azure Container Apps to run any container image that is compatible with the Docker image format and follows the Open Container Initiative (OCI) specification. You can also run Windows or Linux containers on Azure Container Apps.

Azure App Service is a service that allows you to build and host web applications, mobile backends, and RESTful APIs using various languages and frameworks. You can use Azure App Service to run custom container images that are compatible with the Docker image format and follow the App Service Docker image contract. You can also run Windows or Linux containers on Azure App Service.

NEW QUESTION 4

- (Topic 5)

You have an Azure subscription that uses the public IP addresses shown in the following table.

| Name | IP version | SKU | IP address assignment | Availability zone |
|------|------------|----------|-----------------------|-------------------|
| IP1 | IPv6 | Basic | Static | Not applicable |
| IP2 | IPv6 | Basic | Dynamic | Not applicable |
| IP3 | IPv6 | Standard | Static | Zone-redundant |

You need to create a public Azure Standard Load Balancer. Which public IP addresses can you use?

- A. IP1 and IP3 only
- B. IP1, IP2, and IP3
- C. IP2 only
- D. IP3 only

Answer: D

Explanation:

A Basic Load Balancer can use the Basic SKU Public IP address's, but a Standard load balancer requires a Standard SKU Public IP address.

Excerpt from link below:

The standard SKU is required if you associate the address to a standard load balancer. For more information about standard load balancers, see Azure load balancer standard SKU.

<https://learn.microsoft.com/en-us/azure/virtual-network/ip-services/virtual-network-public-ip-address>

Excerpt from link below:

Key scenarios that you can accomplish using Azure Standard Load Balancer include:

-Enable support for load-balancing of IPv6.

<https://learn.microsoft.com/en-us/azure/load-balancer/load-balancer-overview#why-use-azure-load-balancer>

NEW QUESTION 5

- (Topic 5)

You have an Azure App Services web app named App1. You plan to deploy App1 by using Web Deploy.

You need to ensure that the developers of App1 can use their Azure Active Directory (Azure AD) credentials to deploy content to App1. The solution must use the principle of least privilege.

What should you do?

- A. Configure app-level credentials for FTPS.
- B. Assign The Website Contributor role to the developers.
- C. Assign the Owner role to the developers.
- D. Configure user-level credentials for FTPS.

Answer: B

Explanation:

"To secure app deployment from a local computer, Azure App Service supports two types of credentials for local Git deployment and FTP/S deployment. These credentials are not the same as your Azure subscription credentials." <https://learn.microsoft.com/en-us/azure/app-service/deploy-configure-credentials?tabs=cli>

NEW QUESTION 6

- (Topic 5)

You have the Azure virtual networks shown in the following table.

| Name | Address space | Subnet | Resource group Azure region |
|-------|-----------------|-----------------|-----------------------------|
| VNet1 | 10.11.0.0/16 | 10.11.0.0/17 | West US |
| VNet2 | 10.11.0.0/17 | 10.11.0.0/25 | West US |
| VNet3 | 10.10.0.0/22 | 10.10.1.0/24 | East US |
| VNet4 | 192.168.16.0/22 | 192.168.16.0/24 | North Europe |

To which virtual networks can you establish a peering connection from VNet1?

- A. VNet2, VNet3, and VNet4
- B. VNet2only
- C. VNet3 and VNet4 only
- D. VNet2 and VNet3 only

Answer: C

NEW QUESTION 7

HOTSPOT - (Topic 4)

You need to create storage5. The solution must support the planned changes.

Which type of storage account should you use, and which account should you configure as the destination storage account? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Account kind:

BlobStorage

BlockBlobStorage

Storage (general purpose v1)

StorageV2 (general purpose v2)

Destination:

Storage1

Storage2

Storage3

Storage4

Answer:

Account kind:

BlobStorage

BlockBlobStorage

Storage (general purpose v1)

StorageV2 (general purpose v2)

Destination:

Storage1

Storage2

Storage3

Storage4

- A. Mastered
- B. Not Mastered

Answer: A

NEW QUESTION 8

- (Topic 5)

Note: This question is part of a series of questions that present the same scenario. Each

question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.

After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.

You need to ensure that an Azure Active Directory (Azure AD) user named Admin1 is assigned the required role to enable Traffic Analytics for an Azure subscription.

Solution: You assign the Traffic Manager Contributor role at the subscription level to Admin1

- A. Yes
- B. NO

Answer: B

Explanation:

The Traffic Manager Contributor role is not related to Traffic Analytics. Traffic Manager is a service that provides DNS-based load balancing and traffic routing across different regions and endpoints. Traffic Manager Contributor is a role that allows you to create and manage Traffic Manager profiles, endpoints, and geographies1.

Traffic Analytics is a service that provides visibility into user and application activity in your cloud networks. Traffic Analytics analyzes Azure Network Watcher network security group (NSG) flow logs to provide insights into traffic flow in your Azure cloud. With Traffic Analytics, you can visualize network activity, identify hot spots, secure your network, optimize your network deployment, and pinpoint network misconfigurations2.

To enable Traffic Analytics for an Azure subscription, you need to have a role that grants you the following permissions at the subscription level:

? Microsoft.Network/applicationGateways/read
? Microsoft.Network/connections/read
? Microsoft.Network/loadBalancers/read
? Microsoft.Network/localNetworkGateways/read
? Microsoft.Network/networkInterfaces/read
? Microsoft.Network/networkSecurityGroups/read
? Microsoft.Network/publicIPAddresses/read
? Microsoft.Network/routeTables/read
? Microsoft.Network/virtualNetworkGateways/read
? Microsoft.Network/virtualNetworks/read
? Microsoft.OperationallInsights/workspaces/*

Some of the built-in roles that have these permissions are Owner, Contributor, or Network Contributor³. However, these roles also grant other permissions that may not be necessary or desirable for enabling Traffic Analytics. Therefore, the best practice is to use the principle of least privilege and create a custom role that only has the required permissions for enabling Traffic Analytics⁴.

Therefore, to meet the goal of ensuring that an Azure AD user named Admin1 is assigned the required role to enable Traffic Analytics for an Azure subscription, you should create a custom role with the required permissions and assign it to Admin1 at the subscription level.

NEW QUESTION 9

HOTSPOT - (Topic 3)

You need to configure the Device settings to meet the technical requirements and the user requirements.

Which two settings should you modify? To answer, select the appropriate settings in the answer area.

Answer Area

 Save  Discard

Users may join devices to Azure AD ⓘ

AllSelectedNone

Selected
No member selected

Additional local administrators on Azure AD joined devices ⓘ

SelectedNone

Selected
No member selected

Users may register their devices with Azure AD ⓘ

AllNone

Require Multi-Factor Auth to join devices ⓘ

YesNo

Maximum number of devices per user ⓘ

50

Users may sync settings and app data across devices ⓘ

AllSelectedNone

Selected
No member selected

- A. Mastered
B. Not Mastered

Answer: A

Explanation:

Additional local administrators on Azure AD joined devices ⓘ

SelectedNone

Selected
No member selected

Users may register their devices with Azure AD ⓘ

AllNone

Require Multi-Factor Auth to join devices ⓘ

YesNo

Maximum number of devices per user ⓘ

50

Users may sync settings and app data across devices ⓘ

AllSelectedNone

Box 1: Selected

Only selected users should be able to join devices

Box 2: Yes

Require Multi-Factor Auth to join devices.

From scenario:

? Ensure that only users who are part of a group named Pilot can join devices to Azure AD

? Ensure that when users join devices to Azure Active Directory (Azure AD), the users use a mobile phone to verify their identity.

NEW QUESTION 10

- (Topic 3)

You need to implement a backup solution for App1 after the application is moved. What should you create first?

- A. a recovery plan
- B. an Azure Backup Server
- C. a backup policy
- D. a Recovery Services vault

Answer: D

Explanation:

A Recovery Services vault is a logical container that stores the backup data for each

protected resource, such as Azure VMs. When the backup job for a protected resource runs, it creates a recovery point inside the Recovery Services vault.

Scenario:

There are three application tiers, each with five virtual machines. Move all the virtual machines for App1 to Azure.

Ensure that all the virtual machines for App1 are protected by backups. References: <https://docs.microsoft.com/en-us/azure/backup/quick-backup-vm-portal>

NEW QUESTION 10

- (Topic 3)

You need to meet the user requirement for Admin1. What should you do?

- A. From the Subscriptions blade, select the subscription, and then modify the Properties.
- B. From the Subscriptions blade, select the subscription, and then modify the Access control (IAM) settings.
- C. From the Azure Active Directory blade, modify the Properties.
- D. From the Azure Active Directory blade, modify the Groups.

Answer: A

Explanation:

Change the Service administrator for an Azure subscription

? Sign in to Account Center as the Account administrator.

? Select a subscription.

? On the right side, select Edit subscription details.

Scenario: Designate a new user named Admin1 as the service administrator of the Azure subscription.

References: <https://docs.microsoft.com/en-us/azure/billing/billing-add-change-azure-subscription-administrator>

NEW QUESTION 13

- (Topic 3)

You are planning the move of App1 to Azure. You create a network security group (NSG).

You need to recommend a solution to provide users with access to App1. What should you recommend?

- A. Create an outgoing security rule for port 443 from the Internet to the web servers.
- B. Associate the NSG to all the subnets.
- C. Create an incoming security rule for port 443 from the Internet to the web servers.
- D. Associate the NSG to all the subnets.
- E. Create an incoming security rule for port 443 from the Internet to the database server.
- F. Associate the NSG to the subnet that contains the web servers.
- G. Create an outgoing security rule for port 443 from the Internet to the database server.
- H. Associate the NSG to the subnet that contains the web servers.

Answer: C

Explanation:

As App1 is public-facing we need an incoming security rule, related to the access of the web servers.

Scenario: You have a public-facing application named App1. App1 is comprised of the following three tiers: a SQL database, a web front end, and a processing middle tier. Each tier is comprised of five virtual machines. Users access the web front end by using HTTPS only.

NEW QUESTION 15

HOTSPOT - (Topic 3)

You need to identify the storage requirements for Contoso.

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

| Statements | Yes | No |
|---|-----------------------|-----------------------|
| Contoso requires a storage account that supports Blob storage. | <input type="radio"/> | <input type="radio"/> |
| Contoso requires a storage account that supports Azure Table storage. | <input type="radio"/> | <input type="radio"/> |
| Contoso requires a storage account that supports Azure File Storage. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Statement 1: Yes

Contoso is moving the existing product blueprint files to Azure Blob storage which will ensure that the blueprint files are stored in the archive storage tier. Use unmanaged standard storage for the hard disks of the virtual machines. We use Page Blobs for these.

Statement 2: No

Azure Table storage stores large amounts of structured data. The service is a NoSQL datastore which accepts authenticated calls from inside and outside the Azure cloud. Azure tables are ideal for storing structured, non-relational data. Common uses of Table storage include:

- * 1. Storing TBs of structured data capable of serving web scale applications
 - * 2. Storing datasets that don't require complex joins, foreign keys, or stored procedures and can be denormalized for fast access
 - * 3. Quickly querying data using a clustered index
 - * 4. Accessing data using the OData protocol and LINQ queries with WCF Data Service.NET Libraries
- Statement 3: No

File Storage can be used if your business use case needs to deal mostly with standard File extensions like *.docx, *.png and *.bak then you should probably go with this storage option.

NEW QUESTION 20

- (Topic 2)

Which blade should you instruct the finance department auditors to use?

- A. Partner information
- B. Overview
- C. Payment methods
- D. Invoices

Answer: D

Explanation:

You can opt in and configure additional recipients to receive your Azure invoice in an email. This feature may not be available for certain subscriptions such as support offers, Enterprise Agreements, or Azure in Open.

? Select your subscription from the Subscriptions page. Opt-in for each subscription you own. Click Invoices then Email my invoice. A screenshot of a computer

Description automatically generated

? Click Opt in and accept the terms.

Scenario: During the testing phase, auditors in the finance department must be able to review all Azure costs from the past week.

References: <https://docs.microsoft.com/en-us/azure/billing/billing-download-azure-invoice-daily-usage-date>

NEW QUESTION 25

- (Topic 2)

You need to prepare the environment to meet the authentication requirements.

Which two actions should you perform? Each correct answer presents part of the solution. NOTE Each correct selection is worth one point.

- A. Azure Active Directory (AD) Identity Protection and an Azure policy
- B. a Recovery Services vault and a backup policy
- C. an Azure Key Vault and an access policy
- D. an Azure Storage account and an access policy

Answer: C

Explanation:

D: Seamless SSO works with any method of cloud authentication - Password Hash Synchronization or Pass-through Authentication, and can be enabled via Azure AD Connect.
B: You can gradually roll out Seamless SSO to your users. You start by adding the following Azure AD URL to all or selected users' Intranet zone settings by using Group Policy in Active Directory: <https://autologon.microsoftazuread-ssso.com>

NEW QUESTION 28

- (Topic 2)

You need to define a custom domain name for Azure AD to support the planned infrastructure.
Which domain name should you use?

- A. ad.humongousinsurance.com
- B. humongousinsurance.onmicrosoft.com
- C. humongousinsurance.local
- D. humongousinsurance.com

Answer: D

Explanation:

Every Azure AD directory comes with an initial domain name in the form of domainname.onmicrosoft.com.

The initial domain name cannot be changed or deleted, but you can add your corporate domain name to Azure AD as well. For example, your organization probably has other domain names used to do business and users who sign in using your corporate domain name. Adding custom domain names to Azure AD allows you to assign user names in the directory that are familiar to your users, such as 'alice@contoso.com.' instead of 'alice@domain name.onmicrosoft.com'.
Scenario:

Network Infrastructure: Each office has a local data center that contains all the servers for that office. Each office has a dedicated connection to the Internet.

Humongous Insurance has a single-domain Active Directory forest named humongousinsurance.com

Planned Azure AD Infrastructure: The on-premises Active Directory domain will be synchronized to Azure AD.

References:

<https://docs.microsoft.com/en-us/azure/active-directory/fundamentals/add-custom-domain>

NEW QUESTION 33

HOTSPOT - (Topic 1)

You need to implement Role1.

Which command should you run before you create Role1? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

Find-RoleCapability

Get-AzureADDirectoryRole

Get-AzureRmRoleAssignment

Get-AzureRmRoleDefinition

-Name "Reader" |

ConvertFrom-Json

ConvertFrom-String

ConvertTo-Json

ConvertTo-Xml

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

<https://docs.microsoft.com/en-us/azure/role-based-access-control/tutorial-custom-role-powershell>

Get-AzRoleDefinition -Name "Reader" | ConvertTo-Json <https://docs.microsoft.com/en-us/powershell/module/az.resources/get-azroledescription?view=azps-5.9.0>

<https://docs.microsoft.com/en-us/azure/role-based-access-control/tutorial-custom-role-powershell>

<https://docs.microsoft.com/en-us/powershell/module/microsoft.powershell.utility/convertto-json?view=powershell-7.1>

<https://docs.microsoft.com/en-us/powershell/module/azuread/get-azureaddirectoryrole?view=azureadps-2.0>

NEW QUESTION 35

- (Topic 5)

You have an Azure subscription named Subscription1 that contains a virtual network named VNet1. VNet1 is in a resource group named RG1. Subscription1 has a user named User1. User1 has the following roles;

- Reader
- Security Admin
- Security Reader

You need to ensure that User1 can assign the Reader role for VNet1 to other users. What should you do?

Assign User1 the Contributor role for VNet1.

A: Remove User from the Security Reader and Reader roles tot Subscription1.

C. Assign User1 the Network Contributor role for VNet1.

D. Assign User1 the User Access Administrator role for VNet1

Answer: D

Explanation:

<https://docs.microsoft.com/en-us/azure/role-based-access-control/rbac-and-directory-admin-roles#:~:text=The%20User%20Access%20Administrator%20role%20enables%20the%20user%20to%20grant,Azure%20subscriptions%20and%20management%20groups.>

NEW QUESTION 37

- (Topic 5)

You have an Azure AD tenant that contains the groups shown In the following table.

| Name | Type | Security |
|--------|-----------------------|----------|
| Group1 | Security | Enabled |
| Group2 | Mail-enabled security | Enabled |
| Group3 | Microsoft 365 | Enabled |
| Group4 | Microsoft 365 | Disabled |

You purchase Azure Active Directory Premium P2 licenses. To which groups can you assign a license?

- A. Group 1 only
- B. Group1 and Group3 only
- C. Group3 and Group4 only
- D. Group1, Group2, and Group3 only
- E. Group1, Group2, Group3, and Group4

Answer: B

Explanation:

To assign a license to a group, the group must be a security group, not an Office 365 group or a mail-enabled security group1. According to the image, Group1 and Group3 are security groups, while Group2 and Group4 are Office 365 groups. Therefore, only Group1 and Group3 can be assigned a license.

To assign a license to a group, you need to follow these steps2:

? Sign in to the Azure portal with a license administrator account.

? Go to Azure Active Directory > Licenses and select the product license that you want to assign to groups.

? Select Assign at the top of the page and then select Users and groups.

? Search for and select the group that you want to assign the license to and then select OK.

? Select Assignment options to enable or disable specific services within the product license and then select OK.

? Select Assign at the bottom of the page to complete the assignment.

NEW QUESTION 39

- (Topic 5)

You have an Azure subscription that contains multiple virtual machines in the West US Azure region.

You need to use Traffic Analytics in Azure Network Watcher to monitor virtual machine traffic.

Which two resources should you create? Each correct answer presents part of the solution. NOTE: Each correct selection is worth one point.

- A. a Data Collection Rule (OCR) in Azure Monitor
- B. a Log Analytics workspace
- C. an Azure Monitor workbook
- D. a storage account
- E. a Microsoft Sentinel workspace

Answer: BD

Explanation:

To use Traffic Analytics in Azure Network Watcher, you need to create a Log Analytics workspace and a storage account. A Log Analytics workspace is a cloud-based repository that collects and stores data from various sources, such as NSG flow logs. A storage account is a container that provides a unique namespace to store and access your data objects in Azure Storage. You need to enable NSG flow logs and configure them to send data to both the Log Analytics workspace and the storage account. Traffic Analytics analyzes the NSG flow logs and provides insights into traffic flow in your Azure cloud. References:

? Traffic analytics - Azure Network Watcher | Microsoft Learn

? Traffic analytics FAQ - Azure Network Watcher | Microsoft Learn

NEW QUESTION 43

- (Topic 5)

You have an Azure subscription that contains an Azure Stream Analytics job named Job1.
You need to monitor input events for Job1 to identify the number of events that were NOT processed.
Which metric should you use?

- A. Output Events
- B. Backlogged Input Events
- C. Out-of-Order Events
- D. Late Input Events

Answer: B

Explanation:

Backlogged Input Events is a metric that shows the number of input events that are waiting to be processed by the Stream Analytics job1. This metric indicates the performance and health of the job, as well as the input data rate and latency. If the Backlogged Input Events metric is high or increasing, it means that the job is not able to keep up with the incoming events and some events are not processed in a timely manner2.

Output Events is a metric that shows the number of output events that are emitted by the Stream Analytics job1. This metric indicates the output data rate and throughput of the job. It does not show how many input events were not processed by the job.

Out-of-Order Events is a metric that shows the number of input events that arrive out of order based on their timestamp1. This metric indicates the quality and consistency of the input data source. It does not show how many input events were not processed by the job. Late Input Events is a metric that shows the number of input events that arrive after the late arrival window has expired1. This metric indicates the timeliness and reliability of the input data source. It does not show how many input events were not processed by the job.

NEW QUESTION 45

- (Topic 5)

You have an Azure subscription that contains the resources shown in the following table.

| Name | Type |
|------|-----------------|
| LB1 | Load balancer |
| VM1 | Virtual machine |
| VM2 | Virtual machine |

LB1 is configured as shown in the following table.

| Name | Type | Value |
|----------------------|---------------------------|---|
| bepool1 | Backend pool | VM1, VM2 |
| LoadBalancerFrontEnd | Frontend IP configuration | Public IP address |
| hprobe1 | Health probe | Protocol: TCP Port:80 Interval: 5 seconds Unhealthy threshold: 2 |
| rule1 | Load balancing rule | IP version: IPv4 Frontend IP address: LoadBalancerFrontEnd Port: 80 Backend Port: 80 Backend pool: bepool1 Health probe: hprobe1 |

You plan to create new inbound NAT rules that meet the following requirements: Provide Remote Desktop access to VM2 from the internet by using port 3389.

- A. A frontend IP address
- B. A health probe
- C. A load balancing rule
- D. A backend pool

Answer: A

Explanation:

To create an inbound NAT rule, you need to specify a frontend IP address and a frontend port for the load balancer to receive the traffic, and a backend IP address and a backend port for the load balancer to forward the traffic to1. According to the first table, LB1 has only one frontend IP address, which is 40.121.183.105. However, this frontend IP address is already used by the existing inbound NAT rule named rule1, which forwards port 80 to VM1 on port 802. Therefore, you cannot use the same frontend IP address and port for another inbound NAT rule.

To solve this problem, you need to create a new frontend IP address for LB1 before you can create the new inbound NAT rules. You can do this by using the Azure portal, PowerShell, or CLI3. After you create a new frontend IP address, you can use it to create the new inbound NAT rules that meet your requirements.

NEW QUESTION 46

- (Topic 5)

You have an Azur« subscription that contains a virtual machine named VM1 and an Azure key vault named KV1.

You need to configure encryption for VM1. The solution must meet the following requirements:

- Store and use the encryption key in KV1.
- Maintain encryption if VM1 is downloaded from Azure.
- Encrypt both the operating system disk and the data disks. Which encryption method should you use?

- A. encryption at host
- B. customer-managed keys
- C. Azure Disk Encryption
- D. Confidential disk encryption

Answer: C

Explanation:

Azure Disk Encryption is a service that helps you encrypt your Windows and Linux IaaS virtual machine disks¹. It uses BitLocker for Windows and DM-Crypt for Linux to provide volume encryption for the OS and data disks². Azure Disk Encryption requires that you use a key encryption key in Azure Key Vault to encrypt the volume encryption key, which is then stored on the disk. You can use either a service-managed key or a customer-managed key in Azure Key Vault³. Azure Disk Encryption also supports encrypting virtual machine disks that are downloaded from Azure⁴.

NEW QUESTION 49

HOTSPOT - (Topic 5)

You have an Azure subscription. The subscription contains a storage account named storage1 that has the lifecycle management rules shown in the following table.

| Name | Blob prefix | If base blobs were last modified more than (days ago) | Then |
|-------|-----------------------|---|-------------------------|
| Rule1 | container1/ | 3 days | Move to archive storage |
| Rule2 | <i>Not applicable</i> | 5 days | Move to cool storage |
| Rule3 | container2/ | 10 days | Delete the blob |
| Rule4 | container2/ | 15 days | Move to archive storage |

On June 1, you store two blobs in storage1 as shown in the following table.

| Name | Location | Access tier |
|-------|------------|-------------|
| File1 | container1 | Hot |
| File2 | container2 | Hot |

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|--|-----------------------|-----------------------|
| On June 6, File1 will be stored in the Cool access tier. | <input type="radio"/> | <input type="radio"/> |
| On June 7, File2 will be stored in the Cool access tier. | <input type="radio"/> | <input type="radio"/> |
| On June 16, File2 will be stored in the Archive access tier. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Answer Area

| Statements | Yes | No |
|--|-----------------------|----------------------------------|
| On June 6, File1 will be stored in the Cool access tier. | <input type="radio"/> | <input checked="" type="radio"/> |
| On June 7, File2 will be stored in the Cool access tier. | <input type="radio"/> | <input checked="" type="radio"/> |
| On June 16, File2 will be stored in the Archive access tier. | <input type="radio"/> | <input checked="" type="radio"/> |

NEW QUESTION 53

HOTSPOT - (Topic 5)

You have an Azure virtual network named VNet1 that connects to your on-premises network by using a site-to-site VPN. VNet1 contains one subnet named Subnet1.

Subnet1 is associated to a network security group (NSG) named NSG1. Subnet1 contains a basic internal load balancer named ILB1. ILB1 has three Azure virtual machines in the backend pool.

You need to collect data about the IP addresses that connects to ILB1. You must be able to run interactive queries from the Azure portal against the collected data. What should you do? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Resource to create:

| | |
|----------------------------------|---|
| | ▼ |
| An Azure Event Grid | |
| An Azure Log Analytics workspace | |
| An Azure Storage account | |

Resource on which to enable diagnostics:

| | |
|----------------------------|---|
| | ▼ |
| ILB1 | |
| NSG1 | |
| The Azure virtual machines | |

- A. Mastered
 B. Not Mastered

Answer: A

Explanation:

Box 1: An Azure Log Analytics workspace

In the Azure portal you can set up a Log Analytics workspace, which is a unique Log Analytics environment with its own data repository, data sources, and solutions.

Box 2: NSG1

NSG flow logs allow viewing information about ingress and egress IP traffic through a Network security group. Through this, the IP addresses that connect to the ILB can be monitored when the diagnostics are enabled on a Network Security Group.

We cannot enable diagnostics on an internal load balancer to check for the IP addresses. As for Internal LB, it is basic one. Basic can only connect to storage account. Also, Basic LB has only activity logs, which doesn't include the connectivity workflow. So, we need to use NSG to meet the mentioned requirements.

NEW QUESTION 55

HOTSPOT - (Topic 5)

```
{
  "id": "b988327b-7dae-4d00-8925-1cc14fd68be4",
  "properties": {
    "roleName": "Role1",
    "description": "",
    "assignableScopes": [
      "/subscriptions/c691ad84-99f2-42fd-949b-58afd7ef6ab3"
    ],
    "permissions": [
      {
        "actions": [
          "Microsoft.Resources/subscription/resourceGroups/resources/read",
          "Microsoft.Resources/subscription/resourceGroups/read",
          "Microsoft.Resourcehealth/*",
          "Microsoft.Authorization/*/read",
          "Microsoft.Compute/*/read",
          "Microsoft.Support/*",
          "Microsoft.Authorization/*/read",
          "Microsoft.Network/virtualNetworks/read",
          "Microsoft.Resources/deployments/*",
          "Microsoft.Resources/subscription/resourceGroups/read",
          "Microsoft.Storage/storageAccounts/read",

          "Microsoft.Compute/virtualMachines/restart/action",
          "Microsoft.Compute/virtualMachines/*",
          "Microsoft.Compute/disks/*",
          "Microsoft.Compute/availabilitySets/*",
          "Microsoft.Network/virtualNetworks/subnets/join/action",
          "Microsoft.Network/virtualNetworks/subnets/read",
          "Microsoft.Network/virtualNetworks/subnets/virtualMachines/read",
          "Microsoft.Network/networkinterfaces/*",
          "Microsoft.Compute/snapshots/*"
        ],
        "notAction": [
          "Microsoft.Authorization/*/Delete",
          "Microsoft.Authorization/*/Write",
          "Microsoft.Authorization/elevateAccess/action"
        ]
      }
    ]
  }
}
```

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|---|-----------------------|-----------------------|
| Users that are assigned Role1 can assign Role1 to users. | <input type="radio"/> | <input type="radio"/> |
| Users that are assigned Role1 can deploy new virtual machines. | <input type="radio"/> | <input type="radio"/> |
| Users that are assigned Role1 can set a static IP address on a virtual machine. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
B. Not Mastered

Answer: A

Explanation:

Box 1: N
Because doesn't have:
Microsoft.Authorization/*Write - Create roles, role assignments, policy assignments, policy definitions and policy set definitions
Box 2; Yes
Has been assigned;
Microsoft.Compute/virtualMachines/* - Perform all virtual machine actions including create, update, delete, start, restart, and power off virtual machines. Execute scripts on virtual machines.
Box 3: Y
Has been assigned;
Microsoft.Network/networkInterfaces/* - Create and manage network interfaces
See;
<https://learn.microsoft.com/en-us/azure/role-based-access-control/built-in-roles>

NEW QUESTION 59

HOTSPOT - (Topic 5)
You have an Azure subscription that contains the resources shown in the following table.

| Name | Type |
|------------|-------------------------|
| VM1 | Virtual machine |
| storage1 | Storage account |
| Workspace1 | Log Analytics workspace |
| DB1 | Azure SQL database |

You plan to create a data collection rule named DCRI in Azure Monitor.
Which resources can you set as data sources in DCRI, and which resources can you set as destinations in DCRI? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer Area

Data sources:

▼

VM1 only

VM1 and storage1 only

VM1, storage1, and DB1 only

VM1, storage1, Workspace1, and DB1

Destinations:

▼

storage1 only

Workspace1 only

Workspace1 and storage1 only

Workspace1, storage1, and DB1 only1

- A. Mastered
B. Not Mastered

Answer: A

Explanation:

Data Sources: VM1 only Destination: Workspace1 Only

NEW QUESTION 61
HOTSPOT - (Topic 5)

You have the App Service plans shown in the following table.

| Name | Operating system | Location |
|------|------------------|------------|
| ASP1 | Windows | West US |
| ASP2 | Windows | Central US |
| ASP3 | Linux | West US |

You plan to create the Azure web apps shown in the following table.

| Name | Runtime stack | Location |
|---------|---------------|----------|
| WebApp1 | .NET Core 3.0 | West US |
| WebApp2 | ASP.NET 4.7 | West US |

You need to identify which App Service plans can be used for the web apps.
What should you identify? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

WebApp1:

▼

ASP1 only

ASP3 only

ASP1 and ASP2 only

ASP1 and ASP3 only

ASP1, ASP2, and ASP3

WebApp2:

▼

ASP1 only

ASP3 only

ASP1 and ASP2 only

ASP1 and ASP3 only

ASP1, ASP2, and ASP3

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Box 1: ASP1 ASP3
Asp1, ASP3: ASP.NET Core apps can be hosted both on Windows or Linux.
Not ASP2: The region in which your app runs is the region of the App Service plan it's in.
Box 2: ASP1
ASP.NET apps can be hosted on Windows only.

NEW QUESTION 64
- (Topic 5)

You have an Azure subscription that contains the storage accounts shown in the following table.

| Name | Kind | Performance | Replication | Access tier |
|----------|--------------------------------|-------------|--|-------------|
| Storage1 | Storage (general purpose v1) | Premium | Geo-redundant storage (GRS) | None |
| Storage2 | StorageV2 (general purpose v2) | Standard | Locally-redundant storage (LRS) | Cool |
| Storage3 | StorageV2 (general purpose v2) | Premium | Read-access geo-redundant storage (RA-GRS) | Hot |
| Storage4 | BlobStorage | Standard | Locally-redundant storage (LRS) | Hot |

You need to identify which storage account can be converted to zone-redundant storage (ZRS) replication by requesting a live migration from Azure support.
What should you identify?

- A. Storage1
- B. Storage2
- C. Storage3

D. Storage4

Answer: B

Explanation:

<https://learn.microsoft.com/en-us/azure/storage/common/redundancy-migration?tabs=portal>

NEW QUESTION 68

HOTSPOT - (Topic 5)

You have an Azure subscription that contains the resources shown in the following table

| Name | Type |
|--------------------------------------|------------------|
| ManagementGroup1 | Management group |
| RG1 | Resource group |
| 9c8bc1cd-7655-4c66-b3ea-a8ee101d8f75 | Subscription ID |
| Tag1 | Tag |

In Azure Cloud Shell, you need to create a virtual machine by using an Azure Resource Manager (ARM) template.

How should you complete the command? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

\$adminPassword = Read-Host -Prompt "Enter the administrator password" -AsSecureString

New-AzVm
New-AzResource
New-AzTemplateSpec
New-AzResourceGroupDeployment

-Tag Tag1 '
-ResourceGroupName RG1 '
-GroupName ManagementGroup1 '
-Subscription 9c8bc1cd-7655-4c66-b3ea-a8ee101d8f75

- TemplateUri "https://raw.githubusercontent.com/Azure/azure-quickstart-templates/master/101-vm-simple-windows/azuredeploy.json" '
- adminUsername LocalAdministrator -adminPassword \$adminPassword -dnsLabelPrefix ContosoVM1

A. Mastered

B. Not Mastered

Answer: A

Explanation:

NEW QUESTION 70

HOTSPOT - (Topic 5)

You have an Azure subscription. The subscription contains virtual machines that run Windows Server 2016 and are configured as shown in the following table.

| Name | Virtual network | DNS suffix configured in Windows Server |
|------|-----------------|---|
| VM1 | VNET2 | Contoso.com |
| VM2 | VNET2 | None |
| VM3 | VNET2 | Adatum.com |

You create a public Azure DNS zone named adatum.com and a private Azure DNS zone named conioso.com.

You create a virtual network link for contoso.com as shown in the following exhibit.

link1
contoso.com

Save

Discard

Delete

Access Control (IAM)

Virtual network

VNET2

Configuration

☒ Enable auto registration ⓘ

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|---|-----------------------|-----------------------|
| When VM1 starts, a record for VM1 is added to the contoso.com DNS zone. | <input type="radio"/> | <input type="radio"/> |
| When VM2 starts, a record for VM2 is added to the contoso.com DNS zone. | <input type="radio"/> | <input type="radio"/> |
| When VM3 starts, a record for VM3 is added to the adatum.com DNS zone. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
B. Not Mastered

Answer: A

Explanation:
All three VMs are in VNET2. Auto registration is enabled for private Azure DNS zone named contoso.com, which is linked to VNET2. So, VM1, VM2 and VM3 will auto-register their host records to contoso.com.
None of the VM will auto-register to the public Azure DNS zone named adatum.com. You cannot register private IPs on the internet (adatum.com)
Box 1: Yes
Auto registration is enabled for private Azure DNS zone named contoso.com.
Box 2: Yes
Auto registration is enabled for private Azure DNS zone named contoso.com.
Box 3: No
None of the VM will auto-register to the public Azure DNS zone named adatum.com

NEW QUESTION 72
HOTSPOT - (Topic 5)
You have an Azure subscription named Subscription1 that contains the virtual networks in the following table.

| Name | Subnet |
|-------|----------|
| VNet1 | Sybnet11 |
| VNet2 | Subnet12 |
| VNet3 | Subnet13 |

Subscripton1 contains the virtual machines in the following table.

| Name | IP address | Availability set |
|------|------------|------------------|
| VM1 | Subnet11 | AS1 |
| VM2 | Subnet11 | AS1 |
| VM3 | Subnet11 | Not applicable |
| VM4 | Subnet11 | Not applicable |
| VM5 | Subnet12 | Not applicable |
| VM6 | Subnet12 | Not applicable |

In Subscription1, you create a load balancer that has the following configurations:
? Name: LB1
? SKU: Basic
? Type: Internal
? Subnet: Subnet12
? Virtual network: VNET1
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: each correct selection is worth one point.

| Statements | Yes | No |
|--|-----------------------|-----------------------|
| LB1 can balance the traffic between VM1 and VM2. | <input type="radio"/> | <input type="radio"/> |
| LB1 can balance the traffic between VM3 and VM4. | <input type="radio"/> | <input type="radio"/> |
| LB1 can balance the traffic between VM5 and VM6. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
B. Not Mastered

Answer: A

Statements

Yes

No

LB1 can balance the traffic between VM1 and VM2.

LB1 can balance the traffic between VM3 and VM4.

☐

LB1 can balance the traffic between VM5 and VM6.

☐

- (Topic 5)

You have an Azure subscription.

You plan to deploy the Azure container instances shown in the following table.

| Name | Operating system |
|-----------|---|
| Instance1 | Nano Server installation of Windows Server 2019 |
| Instance2 | Server Core installation of Windows Server 2019 |
| Instance3 | Linux |
| Instance4 | Linux |

Which instances can you deploy to a container group?

- A. Instance1 only
B. Instance2only
C. Instance1 and Instance2 only
D. Instance3 and Instance4 only

Answer: D

Explanation:

<https://learn.microsoft.com/en-us/azure/container-instances/container-instances-container-groups> Multi-container groups currently support only Linux containers. For windows containers, Azure Container Instances only supports deployment of a single container instance. While we are working to bring all features to Windows containers, you can find current platform differences in the service

HOTSPOT - (Topic 5)

You have an Azure Active Directory (Azure AD) tenant that contains three global administrators named Admin1, Admin2, and Admin3.

The tenant is associated to an Azure subscription. Access control for the subscription is configured as shown in the Access control exhibit. (Click the Exhibit tab.)

NEW QUESTION 88

- (Topic 5)

You create an Azure VM named VM1 that runs Windows Server 2019. VM1 is configured as shown in the exhibit (Click the Exhibit tab.)

You need to enable Desired State Configuration for VM1. What should you do first?

- A. Mastered
- B. Not Mastered

Answer: A

NEW QUESTION 89

- (Topic 5)

You sign up for Azure Active Directory (Azure AD) Premium.

You need to add a user named admin1@contoso.com as an administrator on all the computers that will be joined to the Azure AD domain.

What should you configure in Azure AD?

- A. Device settings from the Devices blade.
- B. General settings from the Groups blade.
- C. User settings from the Users blade.
- D. Providers from the MFA Server blade.

Answer: A

Explanation:

<https://docs.microsoft.com/en-us/azure/active-directory/devices/assign-local-admin>

NEW QUESTION 90

- (Topic 5)

You have an Azure subscription that contains an Azure Storage account.

You plan to create an Azure container instance named container1 that will use a Docker image named Image1. Image1 contains a Microsoft SQL Server instance that requires persistent storage.

You need to configure a storage service for Container1. What should you use?

- A. Azure Files
- B. Azure Blob storage
- C. Azure Queue storage
- D. Azure Table storage

Answer: A

Explanation:

<https://azure.microsoft.com/en-us/blog/persistent-docker-volumes-with- azure-file-storage/>

NEW QUESTION 91

- (Topic 5)

You have a Recovery Service vault that you use to test backups. The test backups contain two protected virtual machines.

You need to delete the Recovery Services vault. What should you do first?

- A. From the Recovery Service vault, stop the backup of each backup item.
- B. From the Recovery Service vault, delete the backup data.
- C. Modify the disaster recovery properties of each virtual machine.
- D. Modify the locks of each virtual machine.

Answer: A

Explanation:

You can't delete a Recovery Services vault if it is registered to a server and holds backup data. If you try to delete a vault, but can't, the vault is still configured to receive backup data.

Remove vault dependencies and delete vault

In the vault dashboard menu, scroll down to the Protected Items section, and click Backup Items. In this menu, you can stop and delete Azure File Servers, SQL Servers in Azure VM, and Azure virtual machines.

References: <https://docs.microsoft.com/en-us/azure/backup/backup-azure-delete-vault>

NEW QUESTION 95

- (Topic 5)

You have an Azure virtual machine named VM1 and an Azure key vault named Vault1. On VM1, you plan to configure Azure Disk Encryption to use a key encryption key (KEK) You need to prepare Vault1 for Azure Disk Encryption.

Which two actions should you perform on Vault1? Each correct answer presents part of the solution.

NOTE: Each correct selection is worth one point.

- A. Create a new key.
- B. Select Azure Virtual machines for deployment
- C. Configure a key rotation policy.
- D. Create a new secret.
- E. Select Azure Disk Encryption for volume encryption

Answer: AC

Explanation:

To prepare Vault1 for Azure Disk Encryption, you need to perform the following actions on Vault1:

? Create a new key. A key encryption key (KEK) is an encryption key that is used to encrypt the encryption secrets before they are stored in the key vault. You can create a new KEK by using the Azure CLI, the Azure PowerShell, or the Azure portal¹. You can also import an existing KEK from another source, such as a hardware security module (HSM)². The KEK must be a 2048-bit RSA key or a 256-bit AES key³.

? Select Azure Disk Encryption for volume encryption. This is an advanced access policy setting that enables Azure Disk Encryption to access the keys and secrets in the key vault. You can select this setting by using the Azure CLI, the Azure PowerShell, or the Azure portal⁴. You must also enable access to Microsoft Trusted Services if you have enabled the firewall on the key vault.

NEW QUESTION 97

- (Topic 5)

You have five Azure virtual machines that run Windows Server 2016. The virtual machines are configured as web servers.

You have an Azure load balancer named LB1 that provides load balancing services for the virtual machines.

You need to ensure that visitors are serviced by the same web server for each request. What should you configure?

- A. Floating IP (direct server return) to Enabled
- B. Idle Time-out (minutes) to 20
- C. Protocol to UDP
- D. Session persistence to Client IP and Protocol

Answer: D

Explanation:

<https://learn.microsoft.com/en-us/azure/load-balancer/distribution-mode-concepts>

Session persistence: Client IP and protocol - Traffic from the same client IP and protocol is routed to the same backend instance

NEW QUESTION 98

- (Topic 5)

You develop the following Azure Resource Manager (ARM) template to create a resource group and deploy an Azure Storage account to the resource group.

Which cmdlet should you run to deploy the template?

- A. New-AzTenantDeployment
- B. New-AzResourceGroupDeployment
- C. New-AzResource
- D. New-AzOeployment

Answer: B

Explanation:

The New-AzResourceGroupDeployment cmdlet deploys an Azure Resource Manager template to a resource group. You can use this cmdlet to create a new resource group or update an existing one with the resources defined in the template. The template can be a local file or a URI. Then, References: [New-AzResourceGroupDeployment]

NEW QUESTION 100

- (Topic 5)

You plan to move a distributed on-premises app named App1 to an Azure subscription. After the planned move, App1 will be hosted on several Azure virtual machines.

You need to ensure that App1 always runs on at least eight virtual machines during planned Azure maintenance.

What should you create?

- one virtual machine scale set that has 10 virtual machines instances
- A. one Availability Set that has three fault domains and one update domain
- C. one Availability Set that has 10 update domains and one fault domain
- D. one virtual machine scale set that has 12 virtual machines instances

Answer: A

Explanation:

A virtual machine scale set is a group of identical virtual machines that are centrally managed, configured, and updated¹. A virtual machine scale set can automatically increase or decrease the number of virtual machine instances in response to demand or a defined schedule². A virtual machine scale set also provides high availability and fault tolerance by distributing the virtual machine instances across multiple fault domains and update domains³.

A fault domain is a logical group of underlying hardware that share a common power source and network switch. A fault domain can fail due to hardware or software failures, power outages, or network interruptions⁴. A virtual machine scale set can have up to five fault domains in a region.

An update domain is a logical group of underlying hardware that can undergo maintenance or be rebooted at the same time. An update domain can be affected by planned events, such as OS updates, application updates, or configuration changes⁴. A virtual machine scale set can have up to 20 update domains in a region.

By creating a virtual machine scale set that has 10 virtual machine instances, you can ensure that App1 always runs on at least eight virtual machines during planned Azure maintenance. This is because the default configuration of a virtual machine scale set is to have five fault domains and five update domains. This means that at any given time, only one fault domain or one update domain can be unavailable due to maintenance or failure. Therefore, at least eight out of 10 virtual machine instances will be available to run App1. An availability set is another option for providing high availability and fault tolerance for your virtual machines. An availability set is a logical grouping of two or more virtual machines that are deployed across multiple fault domains and update domains. However, an availability set does not provide automatic scaling of resources or load balancing of traffic. You need to manually create and manage the number of virtual machine instances in an availability set.

Therefore, a virtual machine scale set is a better option than an availability set for your scenario. To create a virtual machine scale set, you can follow these steps:

? Sign in to the Azure portal.

? Select Create a resource > Compute > Virtual machine scale set.

? On the Basics tab, enter a name for your scale set, select your subscription and resource group, select Windows Server 2019 as the image type, and enter a username and password for the administrator account.

? On the Instance details tab, select the region where you want to deploy your scale set, select the size of the virtual machine instances, and enter 10 as the initial instance count.

? On the Scaling tab, configure the scaling policy for your scale set based on metrics or schedule.

? On the Load balancing tab, configure the load balancer for your scale set to distribute traffic across the instances.

? On the Management tab, configure the diagnostics settings, automatic OS upgrades, extensions, and backup options for your scale set.

? On the Advanced tab, configure the availability zone, proximity placement group, accelerated networking, host group, and custom script extension options for your scale set.

? On the Tags tab, optionally add tags to your scale set resources.

? On the Review + create tab, review your settings and select Create.

NEW QUESTION 101

HOTSPOT - (Topic 5)

You have an Azure subscription.

You create the following file named Deploy.json.

```
{
  "sku": {
    "name": "Premium_LRS"
  },
  "kind": "StorageV2",
  "properties": {},
  "copy": {
    "name": "storagecopy",
    "count": 3
  }
}
```

You connect to the subscription and run the following commands.

```
New-AzResourceGroup -Name RG1 -Location "centralus"
New-AzResourceGroupDeployment -ResourceGroupName RG1 -TemplateFile "deploy.json"
```

For each of the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|--|-----------------------|-----------------------|
| The commands will create four new resources. | <input type="radio"/> | <input type="radio"/> |
| The commands will create storage accounts in the West US Azure region. | <input type="radio"/> | <input type="radio"/> |
| The first storage account that is created will have a prefix of 0. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:
Answer Area

| Statements | Yes | No |
|--|----------------------------------|----------------------------------|
| The commands will create four new resources. | <input checked="" type="radio"/> | <input type="radio"/> |
| The commands will create storage accounts in the West US Azure region. | <input type="radio"/> | <input checked="" type="radio"/> |
| The first storage account that is created will have a prefix of 0. | <input checked="" type="radio"/> | <input type="radio"/> |

NEW QUESTION 102

- (Topic 5)
Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an Azure subscription that contains 10 virtual networks. The virtual networks are hosted in separate resource groups.
Another administrator plans to create several network security groups (NSGs) in the subscription.
You need to ensure that when an NSG is created, it automatically blocks TCP port 8080 between the virtual networks.
Solution: From the Resource providers blade, you unregister the Microsoft.ClassicNetwork provider.
Does this meet the goal?

- A. Yes
- B. No

Answer: B

Explanation:
No, this does not meet the goal. Unregistering the Microsoft.ClassicNetwork provider does not affect the creation of network security groups (NSGs) in the subscription. The Microsoft.ClassicNetwork provider is used for managing classic deployment model resources, such as virtual networks, network interfaces, and public IP addresses1. However, NSGs are only supported for Resource Manager deployment model resources2. Therefore, unregistering the Microsoft.ClassicNetwork provider will not automatically block TCP port 8080 between the virtual networks.
To meet the goal, you need to create a custom policy definition that enforces a default security rule for NSGs. A policy definition is a set of rules and actions that Azure performs when evaluating your resources3. You can use a policy definition to specify the required properties and values for NSGs, such as the direction, protocol, source, destination, and port of the security rule. You can then assign the policy definition to the subscription scope, so that it applies to all the resource groups and virtual networks in the subscription.

NEW QUESTION 104

HOTSPOT - (Topic 5)
You have the Azure resources shown on the following exhibit.

You plan to track resource usage and prevent the deletion of resources.
To which resources can you apply locks and tags? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Locks:

▼

RG1 and VM1 only

Sub1 and RG1 only

Sub1, RG1, and VM1 only

MG1, Sub1, RG1, and VM1 only

Tenant Root Group, MG1, Sub1, RG1, and VM1

Tags:

▼

RG1 and VM1 only

Sub1 and RG1 only

Sub1, RG1, and VM1 only

MG1, Sub1, RG1, and VM1 only

Tenant Root Group, MG1, Sub1, RG1, and VM1

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:
Box 1: Sub1, RG1, and VM1 only
You can lock a subscription, resource group, or resource to prevent other users in your organization from accidentally deleting or modifying critical resources.
Box 2: Sub1, RG1, and VM1 only
You apply tags to your Azure resources, resource groups, and subscriptions.

NEW QUESTION 108
HOTSPOT - (Topic 5)
You have an Azure subscription that contains a virtual network named VNet1. VNet1 uses an IP address space of 10.0.0.0/16 and contains the subnets in the following table.

| Name | IP address range |
|---------------|------------------|
| Subnet0 | 10.0.0.0/24 |
| Subnet1 | 10.0.1.0/24 |
| Subnet2 | 10.0.2.0/24 |
| GatewaySubnet | 10.0.254.0/24 |

Subnet1 contains a virtual appliance named VM1 that operates as a router. You create a routing table named RT1. You need to route all inbound traffic to VNet1 through VM1. How should you configure RT1? To answer, select the appropriate options in the answer area.
NOTE: Each correct selection is worth one point.

Answer Area

Address prefix

10.0.0.0/16

10.0.1.0/24

10.0.254.0/24

Next hop type:

Virtual appliance

Virtual network

Virtual network gateway

Assigned to:

GatewaySubnet

Subnet0

Subnet1 and Subnet2

Answer:

Answer Area

Address prefix

10.0.0.0/16

10.0.1.0/24

10.0.254.0/24

Next hop type:

Virtual appliance

Virtual network

Virtual network gateway

Assigned to:

GatewaySubnet

Subnet0

Subnet1 and Subnet2

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Box1 : 10.0.0.0/16
Address prefix in networking refer to the destination IP address range. In this scenario, destination is Vnet1 , hence Address prefix will be the address space of Vnet1.
Box 2 : Virtual appliance
Next hop gets the next hop type and IP address of a packet from a specific VM and NIC. Knowing the next hop helps you determine if traffic is being directed to the intended destination, or whether the traffic is being sent nowhere
Next Hop --> VM1 --> Virtual Appliance (You can specify IP address of VM 1 when configuring next hop as virtual appliance)
Box 3 : GatewaySubnet
In the scenario it is asked for all the inbound traffic to Vnet1. Inbound traffic is flowing through SubnetGW. You need to route all inbound traffic from the VPN gateway to VNet1 through VM1. So its traffic from Gateway subnet only.

NEW QUESTION 112

- (Topic 5)
You have an Azure Active Directory (Azure AD) tenant named contoso.com.
You have a CSV file that contains the names and email addresses of 500 external users. You need to create a quest user account in contoso.com for each of the 500 external users.
Solution: from Azure AD in the Azure portal, you use the Bulk create user operation. Does this meet the goal?

- A. Yes
- B. No

Answer: B

Explanation:

<https://learn.microsoft.com/en-us/azure/active-directory/external-identities/tutorial-bulk-invite?source=recommendations>
information and invitation preferences
- Use "Bulk invite users" to prepare a comma-separated value (.csv) file with the user information and invitation preferences
- Upload the .CSV file to Azure AD
- Verify the users were added to the directory

NEW QUESTION 117

- (Topic 5)
You have an Azure subscription that contains the virtual machines shown in the following table.
javascript:void(0)

| Name | Public IP SKU | Connected to | Status |
|------|---------------|---------------|-----------------------|
| VM1 | None | VNET1/Subnet1 | Stopped (deallocated) |
| VM2 | Basic | VNET1/Subnet2 | Running |

You deploy a load balancer that has the following configurations:
• Name: LB1
• Type internal
• SKU: Standard
• Virtual network VNET1
You need to ensure that you can add VM1 and VM2 to the backend pool of LB1.
Solution: You create a Basic SKU public IP address, associate the address to the network interface of VM1, and then start VM1.
Does this meet the goal?

- A. Yes
- B. No

Answer: B

Explanation:

You can only attach virtual machines that are in the same location and on the same virtual network as the LB. Virtual machines must have a standard SKU public IP or no public IP.
The LB needs to be a standard SKU to accept individual VMs outside an availability set or vmss. VMs do not need to have public IPs but if they do have them they have to be standard SKU. Vms can only be from a single network. When they don't have a public IP they are assigned an ephemeral IP.
Also, when adding them to a backend pool, it doesn't matter in which status are the VMs. Note: Load balancer and the public IP address SKU must match when you use them with public IP addresses.

NEW QUESTION 121

HOTSPOT - (Topic 5)
You have an Azure subscription named Subscription1 that contains a virtual network named VNet1. You add the users in the following table.

| User | Role |
|-------|---------------------|
| User1 | Owner |
| User2 | Security Admin |
| User3 | Network Contributor |

Which user can perform each configuration? To answer select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Answer Area

Add a subnet to VNet1:

- User1 only
- User3 only
- User1 and User3 only**
- User2 and User3 only
- User1, User2, and User3

Assign a user the Reader role to VNet1:

- User1 only**
- User2 only
- User3 only
- User1 and User2 only
- User2 and User3 only
- User1, User2, and User3

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

User1 - The Owner Role lets you manage everything, including access to resources.

User3 - The Network Contributor role lets you manage networks, including creating subnets.

User2 - The Security Admin role can view security policies, view security states, edit security policies, view alerts and recommendations, dismiss alerts and recommendations.

NEW QUESTION 125

- (Topic 5)

You have an Azure Active Directory (Azure AD) tenant named contoso.onmicrosoft.com. The User administrator role is assigned to a user named Admin1.

An external partner has a Microsoft account that uses the user1@outlook.com sign in.

Admin1 attempts to invite the external partner to sign in to the Azure AD tenant and receives the following error message: "Unable to invite user user1@outlook.com – Generic authorization exception." You need to ensure that Admin1 can invite the external partner to sign in to the Azure AD tenant.

What should you do?

- A. From the Roles and administrators blade, assign the Security administrator role to Admin1.
- B. From the Organizational relationships blade, add an identity provider.
- C. From the Custom domain names blade, add a custom domain.
- D. From the Users settings blade, modify the External collaboration settings.

Answer: D

Explanation:

You can adjust the guest user settings, their access, who can invite them from "External collaboration settings" check this link <https://docs.microsoft.com/en-us/azure/active-directory/external-identities/delegate-invitations>

NEW QUESTION 130

- (Topic 5)

You create an App Service plan named plan1 and an Azure web app named webapp1. You discover that the option to create a staging slot is unavailable. You need to create a staging slot for plan1.

What should you do first?

- A. From webapp1, modify the Application settings.
- B. From webapp1, add a custom domain.
- C. From plan1, scale up the App Service plan.
- D. From plan1, scale out the App Service plan.

Answer: C

Explanation:

The app must be running in the Standard, Premium, or Isolated tier in order for you to enable multiple deployment slots. If the app isn't already in the Standard, Premium, or Isolated tier, you receive a message that indicates the supported tiers for enabling staged publishing. At this point, you have the option to select Upgrade and go to the Scale tab of your app before continuing.

Scale up: Get more CPU, memory, disk space, and extra features like dedicated virtual machines (VMs), custom domains and certificates, staging slots, autoscaling, and more.

Scale out: Increase the number of VM instances that run your app. You can scale out to as many as 30 instances

Reference:

<https://docs.microsoft.com/en-us/azure/app-service/deploy-staging-slots> <https://docs.microsoft.com/en-us/azure/app-service/manage-scale-up>

NEW QUESTION 133

- (Topic 5)

You have an Azure subscription that contains the resources shown in the following table.

| Name | Type |
|------------|-----------------|
| storage1 | Storage account |
| container1 | Blob container |
| table1 | Storage table |

You need to perform the tasks shown in the following table.

| Name | Task |
|-------|--------------------------------------|
| Task1 | Create a new storage account. |
| Task2 | Upload an append blob to container1. |
| Task3 | Create a file share in storage1. |
| Task4 | Add data to table1. |

Which tasks can you perform by using Azure Storage Explorer?

- A. Task1 and Task3 only
- B. Task1, Task2, and Task3 only
- C. Task1, Task3, and Task4 only
- D. Task2, Task3, and Task4 only
- E. Task1, Task2, Task3, and Task4

Answer: D

NEW QUESTION 134

- (Topic 5)

You have an Azure subscription that contains an Azure SQL database named DB1.

You plan to use Azure Monitor to monitor the performance of DB1. You must be able to run queries to analyze log data.

Which destination should you configure in the Diagnostic settings of DB 1?

- A. Send to a Log Analytics workspace.
- B. Archive to a storage account.
- C. Stream to an Azure event hub.

Answer: A

Explanation:

? According to the Microsoft documentation, Azure Monitor collects and analyzes monitoring data from Azure resources, including Azure SQL databases. You can use Azure Monitor to monitor the performance of DB1 and run queries to analyze log data.

? To use Azure Monitor, you need to configure the diagnostic settings of DB1, which define the sources and destinations of the monitoring data. The sources are the types of metric and log data to send to the destinations, such as SQLInsights, Errors, Blocks, Deadlocks, etc. The destinations are one or more locations where you want to send the monitoring data, such as a Log Analytics workspace, a storage account, or an event hub.

? A Log Analytics workspace is a unique environment for Azure Monitor log data.

Each workspace has its own data repository and configuration, and data sources and solutions are configured to store their data in a particular workspace. You can use a Log Analytics workspace to run queries on the log data collected from DB1 and other resources using the Kusto query language. You can also create alerts, dashboards, and workbooks based on the log data in the workspace.

? A storage account is a place where you can store large amounts of unstructured data, such as files, blobs, queues, tables, and disks. You can use a storage account to archive the monitoring data from DB1 for long-term retention or backup purposes. However, you cannot run queries on the log data in a storage account directly. You would need to use another tool or service to analyze the log data in a storage account.

? An event hub is a service that enables you to ingest and process large volumes of streaming data from multiple sources. You can use an event hub to stream the monitoring data from DB1 to other applications or services that can consume and analyze the data in real time. However, you cannot run queries on the log data in an event hub directly. You would need to use another tool or service to analyze the log data in an event hub.

NEW QUESTION 137

HOTSPOT - (Topic 5)

Your network contains an on-premises Active Directory Domain Services (AD DS) domain named contoso.com. The domain contains the servers shown in the following table.

| Name | IP address | Role |
|---------|-----------------|---------------------------------|
| DC1 | 192.168.2.1/16 | Domain controller DNS server |
| Server1 | 192.168.2.50/16 | Member server |

You plan to migrate contoso.com to Azure.

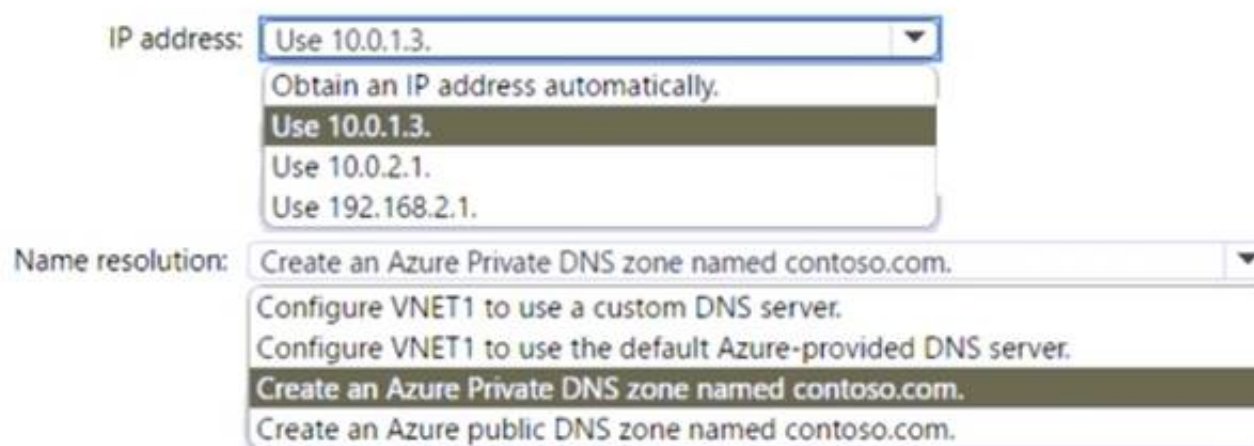

You create an Azure virtual network named VNET1 that has the following settings:

- Address space: 10.0.0.0/16
- Subnet:
 - o Name: Subnet1 o IPv4: 10.0.1.0/24

You need to move DC1 to VNET1. The solution must ensure that the member servers in contoso.com can resolve AD DS DNS names.
 How should you configure DC1? To answer, select the appropriate options in the answer area.

NOTE: Each correct selection is worth one point.

Answer Area

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

? IP address: You should use 10.0.1.3 as the IP address for DC1. This is because DC1 needs to have a static IP address within the subnet range of VNET1, which is 10.0.1.0/24. You cannot use 10.0.2.1 or 192.168.2.1, as they are outside of the subnet range of VNET1. You also cannot obtain an IP address automatically, as this may cause DC1 to lose its IP address and break the DNS resolution for the domain members.

? Name Resolution: You should configure VNET1 to use a custom DNS server that points to the IP address of DC1, which is 10.0.1.3. This is because DC1 is the domain controller and DNS server for contoso.com, and it needs to resolve the AD DS DNS names for the domain members that are in Azure or on-premises. You cannot use the default Azure-provided DNS server, as it does not support AD DS DNS names. You also do not need to create an Azure Private DNS zone or an Azure public DNS zone named contoso.com, as these are not required for AD DS DNS resolution.

NEW QUESTION 142

- (Topic 5)

You have an Azure subscription that contains a user named User1.

You need to ensure that User1 can deploy virtual machines and manage virtual networks. The solution must use the principle of least privilege.

Which role-based access control (RBAC) role should you assign to User1?

- A. Owner
- B. Virtual Machine Administrator Login Contributor
- ☒ C. Virtual Machine Contributor

Answer: D

Explanation:

To ensure that User1 can deploy virtual machines and manage virtual networks, you need to assign an RBAC role that grants the necessary permissions to perform these tasks. The solution must also use the principle of least privilege, which means that you should only grant the minimum level of access required to accomplish the goal.

Based on these requirements, the best RBAC role to assign to User1 is D. Virtual Machine Contributor. This role allows User1 to create and manage virtual machines, disks, snapshots, and network interfaces. It also allows User1 to connect virtual machines to existing virtual networks and subnets. However, it does not allow User1 to create or delete virtual networks or subnets, or to access the virtual machines themselves. This role follows the principle of least privilege by limiting User1's access to only the resources and actions that are relevant to deploying virtual machines and managing virtual networks.

NEW QUESTION 143

- (Topic 5)

You have an Azure App Service app named Appl that contains two running instances. You have an autoscale rule configured as shown in the following exhibit

Criteria

Metric namespace *
Standard metrics

Metric name
Memory Percentage

1 minute time grain

| Dimension Name | Operator | Dimension Values | Add |
|----------------|----------|------------------|-----|
| Instance | = | All values | + |

if you select multiple values for a dimension, autoscale will aggregate the metric across the selected values, not evaluate the metric for each values individually.

MemoryPercentage (Average)

39.28 %

☐ Enable metric divide by instance count ⓘ

Time aggregation * ⓘ

Average

Action

Operation *

Increase count by

Cool down (minutes) * ⓘ

5

instance count *

1

✓

For the instance limits stale condition setting, you set Maximum to 5. During a 30-minute period, Appl uses 60 percent of the available memory. What is the maximum number of instances for Appl during the 30-minute period:

- A. 2
B. 3
C. 4
D. 5

Answer: C

Explanation:

The exhibit shows that you have an autoscale rule configured for your App Service app named App1. The rule is based on the memory percentage metric, which measures the average amount of memory used by all the instances of your app. The rule has the following settings:

? Scale out action: Add 1 instance when the memory percentage is greater than or equal to 80% for a duration of 10 minutes.

? Scale in action: Remove 1 instance when the memory percentage is less than or equal to 60% for a duration of 10 minutes.

? Instance limits: The minimum number of instances is 2, and the maximum number of instances is 5.

According to the question, during a 30-minute period, App1 uses 60% of the available memory. This means that the scale in action is triggered, but not the scale out action. Therefore, one instance is removed from App1 every 10 minutes, until the minimum number of instances is reached.

Since App1 initially has two running instances, after the first 10 minutes, one instance is removed and App1 has one instance left. However, since the minimum number of instances is set to 2, another instance is added back to App1 to meet the minimum requirement. Therefore, after the first 10 minutes, App1 still has two instances.

After the second 10 minutes, the same process repeats. One instance is removed due to the scale in action, and another instance is added back due to the minimum requirement. Therefore, after the second 10 minutes, App1 still has two instances.

After the third 10 minutes, there is no change in the number of instances, because App1 already has the minimum number of instances. Therefore, after the third 10 minutes, App1 still has two instances.

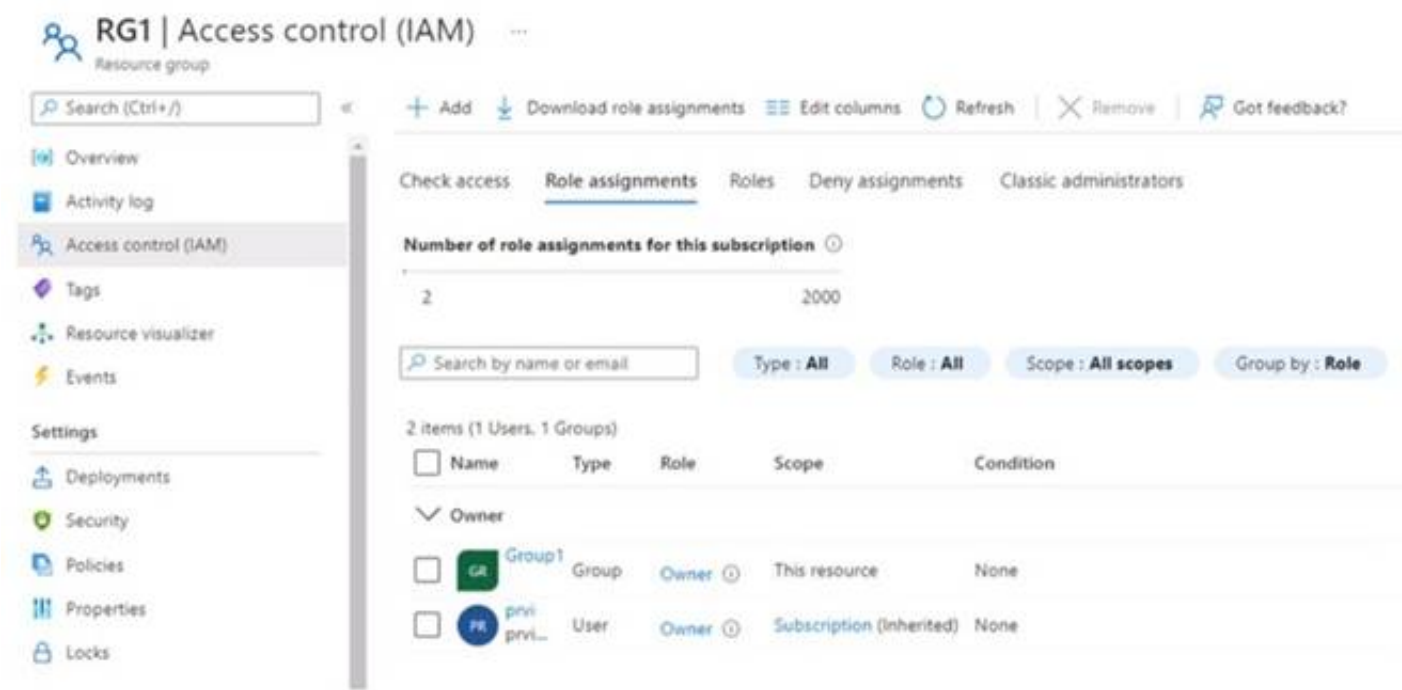

Therefore, during the 30-minute period, App1 never has more than two instances running at any given time. However, since one instance is removed and added back every 10 minutes, there are four different instances that are used by App1 during the period. Hence, the maximum number of instances for App1 during the period is four.

NEW QUESTION 144

HOTSPOT - (Topic 5)

You have an Azure subscription that contains

the users shown in the following table. The groups are configured as shown in the following table.

For each of the following statements, select Yes if the statement is true. Otherwise, select No. NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|--|-----------------------|-----------------------|
| You can assign User2 the Owner role for RG1 by adding Group2 as a member of Group1. | <input type="radio"/> | <input type="radio"/> |
| You can assign User3 the Owner role for RG1 by adding Group3 as a member of Group1. | <input type="radio"/> | <input type="radio"/> |
| You can assign User3 the Owner role for RG1 by assigning the Owner role to Group3 for RG1. | <input type="radio"/> | <input type="radio"/> |

Answer:

Answer Area

| Statements | Yes | No |
|--|----------------------------------|----------------------------------|
| You can assign User2 the Owner role for RG1 by adding Group2 as a member of Group1. | <input type="radio"/> | <input checked="" type="radio"/> |
| You can assign User3 the Owner role for RG1 by adding Group3 as a member of Group1. | <input type="radio"/> | <input checked="" type="radio"/> |
| You can assign User3 the Owner role for RG1 by assigning the Owner role to Group3 for RG1. | <input checked="" type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

<https://learn.microsoft.com/en-us/azure/active-directory/roles/groups-concept#how-are-role-assignable-groups-protected>
"Group nesting isn't supported. A group can't be added as a member of a role-assignable group."
For the second question:
<https://learn.microsoft.com/en-us/azure/active-directory/fundamentals/how-to-manage-groups#add-or-remove-a-group-from-another-group>
"We currently don't support:
Adding Microsoft 365 groups to Security groups or other Microsoft 365 groups. "
For the third question, although it appears truncated in the screenshot (ending with "for...") there is a reference about Microsoft 365 groups support for roles assignment here: <https://learn.microsoft.com/en-us/azure/active-directory/roles/groups-concept#how-role-assignments-to-groups-work>
"To assign a role to a group, you must create a new security or Microsoft 365 group with the is AssignableToRole property set to true. "

NEW QUESTION 146

HOTSPOT - (Topic 5)

You have an Azure subscription that contains the resource groups shown in the following table.

| Name | Location |
|------|----------|
| RG1 | East US |
| RG2 | West US |

You create the following Azure Resource Manager (ARM) template named deploy.json.

```
{
  "$schema": "https://schema.management.azure.com/schemas/2015-01-01/deploymentTemplate.json#",
  "contentVersion": "1.0.0.0",
  "parameters": {},
  "variables": {},
  "resources": [
    {
      "type": "Microsoft.Resources/resourceGroups",
      "apiVersion": "2018-05-01",
      "location": "eastus",
      "name": "[concat('RG', copyIndex())]",
      "copy": {
        "name": "copy",
        "count": 4
      }
    }
  ],
  "outputs": {}
}
```

You deploy the template by running the following cmdlet.

Item-AzSubscriptionDeployment -location -Template file deploy-json For each or the following statements, select Yes if the statement is true. Otherwise, select No.

NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|--|-----------------------|-----------------------|
| The commands will create four new resources. | <input type="radio"/> | <input type="radio"/> |
| The commands will create storage accounts in the West US Azure region. | <input type="radio"/> | <input type="radio"/> |
| The first storage account that is created will have a prefix of 0. | <input type="radio"/> | <input type="radio"/> |

Answer:

Answer Area

| Statements | Yes | No |
|--|----------------------------------|----------------------------------|
| The commands will create four new resources. | <input checked="" type="radio"/> | <input type="radio"/> |
| The commands will create storage accounts in the West US Azure region. | <input type="radio"/> | <input checked="" type="radio"/> |
| The first storage account that is created will have a prefix of 0. | <input checked="" type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

NEW QUESTION 150

- (Topic 5)

You have an Azure virtual machine named VM1 that runs Windows Server 2019.

You save VM1 as a template named Template1 to the Azure Resource Manager library. You plan to deploy a virtual machine named VM2 from Template1. What can you configure during the deployment of VM2?

- A. virtual machine size
- B. operating system
- C. administrator username
- D. resource group

Answer: D

Explanation:

Resource Group is the correct Answer Admin user, password, vm size and os are the part of ARM templates. But resource group is not hence needs to be mentioned while deployment! Refer below sample ARM template for reference in which all above attributes passed in parameter. <https://github.com/Azure/azure-quickstart-templates/blob/master/101-vm-simple-windows/azuredeploy.json>

NEW QUESTION 151

- (Topic 5)

Your company has an Azure subscription named Subscription1.

The company also has two on-premises servers named Server1 and Server2 that run Windows Server 2016. Server1 is configured as a DNS server that has a primary DNS zone named adatum.com. Adatum.com contains 1,000 DNS records.

You manage Server1 and Subscription1 from Server2. Server2 has the following tools installed:

- ? The DNS Manager console
- ? Azure PowerShell
- ? Azure CLI 2.0

You need to move the adatum.com zone to Subscription1. The solution must minimize administrative effort.

What should you use?

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Azure DNS supports importing and exporting zone files by using the Azure command-line interface (CLI). Zone file import is not currently supported via Azure PowerShell or the Azure portal.

References: <https://docs.microsoft.com/en-us/azure/dns/dns-import-export>

NEW QUESTION 156

- (Topic 5)

You have an Azure subscription that contains a resource group named RG26.

RG26 is sot to the West Europe location and is used to create temporary resources for a project. RG26 contains the resources shown in the following table.

| Name | Type | Location |
|---------|---------------------------|--------------|
| VM1 | Virtual machine | North Europe |
| RGV1 | Recovery Services vault | North Europe |
| SQLDB01 | Azure SQL database | North Europe |
| AZSQL01 | Azure SQL database server | North Europe |
| sa001 | Storage account | West Europe |

SQLD01 is backed up to RGV1.

When the project is complete, you attempt to delete RG26 from the Azure portal. The deletion fails.

You need to delete RG26. What should you do first?

- A. Stop the backup of SQLDB01.
- B. Delete sa001.
- C. Delete VM1.
- D. StopVM1.

Answer: A

Explanation:

You can't delete a vault that contains backup data. So in this case at first you have to delete the backup of 'SQLD01' before you attempt to delete the vault.

Reference:

<https://docs.microsoft.com/en-us/azure/backup/backup-azure-delete-vault>

NEW QUESTION 160

- (Topic 5)

You have an Azure Subscription that contains the virtual networks Shown in the following table.

| Name | Location |
|--------|-----------|
| Vnet1 | US East |
| Vnet2 | US East |
| Vnet3 | US East |
| Vnet4 | UK South |
| Vnet5 | UK South |
| Vnet6 | UK South |
| Vnet7 | Asia East |
| Vnet8 | Asia East |
| Vnet9 | Asia East |
| Vnet10 | Asia East |

All the virtual networks are peered. Each virtual network contains nine virtual machines. You need to configure secure RDP corrections to the virtual machines by using Azure Boston.

Whit is the minimum number of Bastion nests required?

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

? According to the Microsoft documentation, Azure Bastion is a service that provides more secure and seamless RDP and SSH access to virtual machines without any exposure through public IP addresses. You can provision the service directly in your local or peered virtual network to get support for all the VMs within it.

? In your scenario, you have three virtual networks that are peered with each other.

This means that they can communicate with each other as if they were in the same virtual network. Therefore, you can deploy one Bastion host in any of the virtual networks and use it to connect to all the virtual machines in the peered virtual networks. You don't need to deploy a separate Bastion host for each virtual network or each virtual machine.

? For more information about how to deploy and use Azure Bastion, see Tutorial:

Deploy Bastion using specified settings: Azure portal.

NEW QUESTION 163

HOTSPOT - (Topic 5)

You have an Azure subscription that contains a virtual network named VNET in the East Us 2 region. A network interface named VM1-NI is connected to VNET1. You successfully deploy the following Azure Resource Manager template.

```
{
  "apiVersion": "2017-03-30",
  "type": "Microsoft.Compute/virtualMachines",
  "name": "VM1",
  "zones": "1",
  "location": "EastUS2",
  "dependsOn": [
    "[resourceId('Microsoft.Network/networkInterfaces', 'VM1-NI')]"
  ],
  "properties": {
    "hardwareProfile": {
      "vmSize": "Standard_A2_v2"
    },
    "osProfile": {
      "computerName": "VM1",
      "adminUsername": "AzureAdmin",
      "adminPassword": "[parameters('adminPassword')]"
    },
    "storageProfile": {
      "imageReference": "[variables('image')]",
      "osDisk": {
        "createOption": "FromImage"
      }
    },
    "networkProfile": {
      "networkInterfaces": [
        {
          "id": "[resourceId('Microsoft.Network/networkInterfaces', 'VM1-NI')]"
        }
      ]
    }
  }
},
{
  "apiVersion": "2017-03-30",
  "type": "Microsoft.Compute/virtualMachines",
  "name": "VM2",
  "zones": "2",
  "location": "EastUS2",
  "dependsOn": [

```

Answer Area

| | Yes | No |
|--|-----------------------|-----------------------|
| VM1 and VM2 can connect to VNET1. | <input type="radio"/> | <input type="radio"/> |
| If an Azure datacenter becomes unavailable, VM1 or VM2 will be available. | <input type="radio"/> | <input type="radio"/> |
| If the East US 2 region becomes unavailable, VM1 or VM2 will be available. | <input type="radio"/> | <input type="radio"/> |

Answer:

Answer Area

| | Yes | No |
|--|----------------------------------|----------------------------------|
| VM1 and VM2 can connect to VNET1. | <input checked="" type="radio"/> | <input type="radio"/> |
| If an Azure datacenter becomes unavailable, VM1 or VM2 will be available. | <input checked="" type="radio"/> | <input type="radio"/> |
| If the East US 2 region becomes unavailable, VM1 or VM2 will be available. | <input type="radio"/> | <input checked="" type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

A close-up of a computer screen Description automatically generated
 "A resource can only be created in a virtual network that exists in the same region and subscription as the resource." <https://learn.microsoft.com/en-us/azure/virtual-network/virtual-network-vnet-plan-design-arm#regions>

NEW QUESTION 167

HOTSPOT - (Topic 5)

You have an Azure subscription that contains the virtual networks shown in the following table.

| Name | Location | Peered with |
|-------|----------|--------------|
| VNet1 | East US | VNet2 |
| VNet2 | East US | VNet1, VNet3 |
| VNet3 | West US | VNet2 |

The subscription contains the virtual machines shown in the following table.

| Name | Operating system | Connected to |
|------|------------------|--------------|
| VM1 | Windows | VNet1 |
| VM2 | Linux | VNet2 |
| VM3 | Windows | VNet3 |

Each virtual machine contains only a private IP address.
 You create an Azure bastion for VNet1 as shown in the following exhibit.

B. Not Mastered

Answer: A

Explanation:

NEW QUESTION 170

DRAG DROP - (Topic 5)

You have an Azure subscription that contains the resources shown in the following table.

| Name | Type | Description |
|------|------------------------------|-------------------------------------|
| vm1 | Virtual machine | Uses a basic public IP address |
| vm2 | Virtual machine | Uses a basic public IP address |
| nsg1 | Network security group (NSG) | Allows incoming traffic to port 443 |
| lb1 | Azure Standard Load Balancer | None |

You need to load balance HTTPS connections to vm1 and vm2 by using lb1.
Which three actions should you perform in sequence? To answer, move the appropriate actions from the list of actions to the answer area and arrange them in the correct order.

Actions

Remove nsg1.

Create an availability set.

Remove the public IP addresses from vm1 and vm2.

Create a health probe and backend pool on lb1.

Create a load balancing rule on lb1.

NEW QUESTION 174

HOTSPOT - (Topic 5)

You have two Azure virtual machines as shown in the following table.

| Name | Operating system | Private IP address | Public IP address | DNS suffix configured in the operating system | Connected to |
|------|--|--------------------|-------------------|---|--------------|
| vm1 | Windows Server 2019 | 10.0.1.4 | 131.107.50.20 | Contoso.com | vnet1 |
| vm2 | SUSE Linux Enterprise Server 15 (SLES) SP2 | 10.0.1.5 | 131.107.90.80 | None | vnet1 |

You create the Azure DNS zones shown in the following table.

| Name | Type |
|--------------|------------------|
| Contoso.com | DNS zone |
| Fabrikam.com | Private DNS zone |

You perform the following actions:
? To fabrikam.com, you add a virtual network link to vnet1 and enable auto registration.
? For contoso.com, you assign vm1 and vm2 the Owner role.
For each of the following statements, select Yes if the statement is true. Otherwise, select No.
NOTE: Each correct selection is worm one point.

| Statements | Yes | No |
|---|-----------------------|-----------------------|
| The DNS A record for vm1 is added to contoso.com and has the IP address of 131.107.50.20. | <input type="radio"/> | <input type="radio"/> |
| The DNS A record for vm1 is added to fabrikam.com and has the IP address of 10.0.1.4. | <input type="radio"/> | <input type="radio"/> |
| The DNS A record for vm2 is added to fabrikam.com and has the IP address of 10.0.1.5. | <input type="radio"/> | <input type="radio"/> |

- A. Mastered
B. Not Mastered

Answer: A

Explanation:

| Statements | Yes | No |
|---|----------------------------------|----------------------------------|
| The DNS A record for vm1 is added to contoso.com and has the IP address of 131.107.50.20. | <input checked="" type="radio"/> | <input type="radio"/> |
| The DNS A record for vm1 is added to fabrikam.com and has the IP address of 10.0.1.4. | <input checked="" type="radio"/> | <input type="radio"/> |
| The DNS A record for vm2 is added to fabrikam.com and has the IP address of 10.0.1.5. | <input type="radio"/> | <input checked="" type="radio"/> |

NEW QUESTION 179

- (Topic 5)

You have an Azure Active Directory (Azure AD) tenant.

You plan to delete multiple users by using Bulk delete in the Azure Active Directory admin center.

You need to create and upload a file for the bulk delete. Which user attributes should you include in the file?

- A. The user principal name and usage location of each user only
B. The user principal name of each user only
C. The display name of each user only
D. The display name and usage location of each user only
E. The display name and user principal name of each user only

Answer: B

Explanation:

To perform a bulk delete of users in Azure Active Directory, you need to create and upload a CSV file that contains the list of users to be deleted. The file should include the user principal name (UPN) of each user only. Therefore, the answer is B. The user principal name of each user only. When you use the bulk delete feature in the Azure Active Directory admin center, you need to specify the UPN for each user that you want to delete. The UPN is a unique identifier for each user in Azure AD and is the primary way that Azure AD identifies and manages user accounts. Including additional attributes like the display name or usage location is not required for the bulk delete operation, as the UPN is the only mandatory attribute for the user account. However, you may include additional attributes in the CSV file if you want to keep track of the metadata associated with each user account.

NEW QUESTION 181

HOTSPOT - (Topic 5)

You have two Azure subscriptions named Sub1 and Sub2. Sub1 is in a management group named MG1. Sub2 is in a management group named MG2.

You have the resource groups shown in the following table.

| Name | Subscription |
|------|--------------|
| RG1 | Sub1 |
| RG2 | Sub2 |

You have the virtual machines shown in the following table.

| Name | Resource group |
|------|----------------|
| VM1 | RG1 |
| VM2 | RG2 |
| VM3 | RG2 |

You assign roles to users as shown in the following table.

| User | Role | Resource |
|-------|-----------------------------|----------|
| User1 | Virtual Machine Contributor | MG1 |
| User1 | Virtual Machine User Login | Sub2 |
| User2 | Virtual Machine Contributor | MG2 |
| User2 | Virtual Machine User Login | Sub1 |
| User2 | Virtual Machine User Login | VM3 |

For each of the following statements, select Yes if the statement is true. Otherwise, select No.
 NOTE: Each correct selection is worth one point.

Answer Area

| Statements | Yes | No |
|---|-----------------------|-----------------------|
| User1 can sign in to VM1. | <input type="radio"/> | <input type="radio"/> |
| User2 can manage disks and disk snapshots of VM1. | <input type="radio"/> | <input type="radio"/> |
| User2 can manage disks and disk snapshots of VM3. | <input type="radio"/> | <input type="radio"/> |

Answer:

Answer Area

| Statements | Yes | No |
|---|----------------------------------|----------------------------------|
| User1 can sign in to VM1. | <input checked="" type="radio"/> | <input type="radio"/> |
| User2 can manage disks and disk snapshots of VM1. | <input type="radio"/> | <input checked="" type="radio"/> |
| User2 can manage disks and disk snapshots of VM3. | <input checked="" type="radio"/> | <input type="radio"/> |

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

User 2 has the Disk Snapshot Contributor role assigned at the scope of MG2. This role allows the user to manage disk snapshots in the management group. VM3 is a virtual machine in RG3, which is in Sub2, which is in MG2. Therefore, User 2 has the permission to manage disks and disk snapshots of VM3.

NEW QUESTION 183

HOTSPOT - (Topic 5)

You purchase a new Azure subscription named Subscription1.

You create a virtual machine named VM1 in Subscription1. VM1 is not protected by Azure Backup.

You need to protect VM1 by using Azure Backup. Backups must be created at 01:00 and stored for 30 days.

What should you do? To answer, select the appropriate options in the answer area. NOTE: Each correct selection is worth one point.

Answer Area

Location in which to store the backups:

▼

A blob container

A file share

A Recovery Services vault

A storage account

Object to use to configure the protection for VM1:

▼

A backup policy

A batch job

A batch schedule

A recovery plan

Answer:

Answer Area

Location in which to store the backups:

A blob container

A file share

A Recovery Services vault

A storage account

Object to use to configure the protection for VM1:

A backup policy

A batch job

A batch schedule

A recovery plan

- A. Mastered
- B. Not Mastered

Answer: A

Explanation:

Box 1: A Recovery Services vault
A Recovery Services vault is an entity that stores all the backups and recovery points you create over time.
Box 2: A backup policy

What happens when I change my backup policy?
When a new policy is applied, schedule and retention of the new policy is followed.

References:

https://docs.microsoft.com/en-us/azure/backup/backup-configure-vault https://docs.microsoft.com/en-us/azure/backup/backup-azure-backup-faq
A Recovery Services vault is a storage entity in Azure that houses data. The data is typically copies of data, or configuration information for virtual machines (VMs), workloads, servers, or workstations. You can use Recovery Services vaults to hold backup data for various Azure services such as IaaS VMs (Linux or Windows) and Azure SQL databases. You can use backup policy to configure schedule.

NEW QUESTION 186
- (Topic 5)

Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution.
After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen.
You have an app named App1 that is installed on two Azure virtual machines named VM1 and VM2. Connections to App1 are managed by using an Azure Load Balancer.
The effective network security configurations for VM2 are shown in the following exhibit.

Home > VM2 - Networking

VM2 - Networking

Outbound port rules

Application security groups

Load balancing

Network security group NSG2 (attached to subnet: Subnet11)

Impacts 1 subnets, 0 network interfaces

Add inbound port rule

| Priority | Name | Port | Protocol | Source | Destination | Action |
|----------|-------------------------------|------|----------|-------------------|----------------|--------|
| 100 | Allow_131.107.100.50 | 443 | TCP | 131.107.100.50 | VirtualNetwork | Allow |
| 200 | BlockAllOther443 | 443 | Any | Any | Any | Deny |
| 65000 | AllowVnetInbound | Any | Any | VirtualNetwork | VirtualNetwork | Allow |
| 65001 | AllowAzureLoadBalancerInbound | Any | Any | AzureLoadBalancer | Any | Allow |
| 65500 | DenyAllInbound | Any | Any | Any | Any | Deny |

You discover that connections to App1 from 131.107.100.50 over TCP port 443 fail. You verify that the Load Balancer rules are configured correctly.
You need to ensure that connections to App1 can be established successfully from 131.107.100.50 over TCP port 443.
Solution: You modify the priority of the Allow_131.107.100.50 inbound security rule. Does this meet the goal?

- A. Yes
- B. No

Answer: B
