Administering Windows Server Hybrid Core Infrastructure

NEW QUESTION 1
SIMULATION - (Topic 4)
Task 9
You plan to create group managed service accounts (gMSAs).
You need to configure the domain to support the creation of gMSAs.

A. Mastered
B. Not Mastered

Answer: A

Explanation:
To configure the domain to support the creation of gMSAs, you need to perform the following steps:
? On a domain controller or a computer that has the Remote Server Administration
Tools (RSAT) installed, open PowerShell as an administrator and run the following command to install the Active Directory module:
Install-WindowsFeature -Name RSAT-AD-PowerShell
? Run the following command to create a Key Distribution Service (KDS) root key, which is required for generating passwords for gMSAs. You only need to do this once per domain:
Add-KdsRootKey -EffectiveImmediately
? Wait for at least 10 hours for the KDS root key to replicate to all domain controllers in the domain. Alternatively, you can use the -EffectiveTime parameter to specify a past date and time for the KDS root key, but this is not recommended for security reasons. For more information, see Add-KdsRootKey.
? After the KDS root key is replicated, you can create and configure gMSAs using
the New-ADServiceAccount and Set-ADServiceAccount cmdlets. For more information, see Create a gMSA and Configure a gMSA.

NEW QUESTION 2
SIMULATION - (Topic 4)
Task 3
You need to configure SRV1 as a DNS server. SRV1 must be able resolve names from the contoso.com domain by using DC1. All other names must be resolved by using the root hint servers.

A. Mastered
B. Not Mastered

Answer: A

Explanation:
One possible solution to configure SRV1 as a DNS server that can resolve names from the contoso.com domain by using DC1 and all other names by using the root hint servers is to use conditional forwarding. Conditional forwarding allows a DNS server to forward queries for a specific domain name to another DNS server, while using the normal forwarding or root hint servers for other queries. Here are the steps to configure conditional forwarding on SRV1:
? On SRV1, open DNS Manager from the Administrative Tools menu or by typing dnsmgmt.msc in the Run box.
? In the left pane, right-click on Conditional Forwarders and select New Conditional
Forwarder.
? In the New Conditional Forwarder dialog box, enter contoso.com as the DNS Domain name.
? In the IP addresses of the master servers box, enter the IP address of DC1, which is the DNS server for the contoso.com domain. You can also click on Resolve to verify the name resolution of DC1.
? Optionally, you can check the box Store this conditional forwarder in Active Directory, and replicate it as follows if you want to store and replicate the conditional forwarder in AD DS. You can also select the replication scope from the drop-down list.
? Click OK to create the conditional forwarder.
Now, SRV1 will forward any queries for the contoso.com domain to DC1, and use the root hint servers for any other queries. You can test the name resolution by using
the nslookup command on SRV1 or another computer that uses SRV1 as its DNS server. For example, you can run the following commands:
nslookup www.contoso.com nslookup www.microsoft.com
The first command should return the IP address of www.contoso.com from DC1, and the second command should return the IP address of www.microsoft.com from a root hint server.

NEW QUESTION 3
SIMULATION - (Topic 4)
Task 4
You need to register SRV1 to sync Azure file shares The registration must use the 34646045 Storage Sync Service.
The required source files are located in a folder named \\dc1.contoso.com\install.
You do NOT need to configure file share synchronization at this time and you do NOT need to update the agent.

A. Mastered
B. Not Mastered

Answer: A

Explanation:
One possible solution to register SRV1 to sync Azure file shares using the 34646045 Storage Sync Service is to use the Register-AzStorageSyncServer cmdlet from the Az.StorageSync module. This cmdlet establishes a trust relationship between the server
and the Storage Sync Service, which is required for creating server endpoints and syncing files. Here are the steps to register SRV1
using the cmdlet:
? On SRV1, open PowerShell as an administrator and run the following command to
install the Az.StorageSync module if it is not already installed: Install-Module -Name Az.StorageSync
? Run the following command to import the Az.StorageSync module:
Import-Module -Name Az.StorageSync
? Run the following command to sign in to your Azure account and select the subscription that contains the 34646045 Storage Sync Service:
Connect-AzAccount
Select-AzSubscription -SubscriptionId <your-subscription-id>

? Run the following command to register SRV1 with the 34646045 Storage Sync Service. You need to specify the resource group name and the Storage Sync Service name as parameters:
Register-AzStorageSyncServer -ResourceGroupName <your-resource-group-name> - StorageSyncServiceName 34646045
? Wait for the registration to complete. You can verify the registration status by
checking the Registered servers tab on the Azure portal or by running the following command:
Get-AzStorageSyncServer -ResourceGroupName <your-resource-group-name> - StorageSyncServiceName 34646045
Now, SRV1 is registered with the 34646045 Storage Sync Service and ready to sync Azure file shares. You can create server endpoints on SRV1 and cloud endpoints on the Azure file shares to define the sync topology.

B. a conditional forwarder
C. a delegation
D. a secondary zone
E. a reverse lookup zone

Answer: AB

Explanation:
A conditional forwarder is required for contoso.com. A forwarder is required for all other domains.
