A user wishes to perform the same work tasks on several assets simultaneously. How can this be configured?

A. A Route should be created with each stop being one Asset and the Job Plan associated with the Route record.
B. A Master Job Plan should be created with Tasks for each Asset.
C. A Work Order Hierarchy should be created against the same Job Plan used for all stops.
D. The Assets should be specified on the Multiple Assets, Locations and CIs table on the Work Order.

Answer: D

Explanation:
In IBM Maximo Manage, when the same work tasks need to be applied simultaneously to multiple assets, the recommended method is to use the Multiple Assets, Locations, and CIs table on a single Work Order. This approach allows users to specify multiple assets for the work order without creating separate child work orders or task hierarchies, streamlining record management and reducing complexity.
? Multiple Assets, Locations and CIs Table: This table allows the user to list all
assets requiring the same work on a single work order. When tasks are defined on
the work order, they apply uniformly across all assets listed in this table. This method is efficient for routine inspections, simple tasks, or other repetitive maintenance where the same task applies to multiple assets
? Routes as an Alternative: A route could also be configured so that each route stop (representing different assets or locations) populates the Multiple Assets, Locations, and CIs table on a single work order when applied. This allows for sequence control and record management while still using a single main work order
This setup minimizes the need to manage multiple child work orders or complex work order hierarchies, particularly when performing similar tasks on several assets simultaneously.

NEW QUESTION 62
What information can be updated in the Master PM application for an associated Preventive Maintenance record (PM)?

A. Work Order Status
B. PM Forecast
C. Generate Work Orders
D. PM Hierarchy

Answer: D

Explanation:
In IBM Maximo Manage v8.0, the Master PM application is used to manage and control multiple Preventive Maintenance (PM) records through a central template known as the Master PM. The primary purpose of the Master PM application is to provide a standardized structure for PMs and streamline the maintenance process by enabling centralized updates to associated PM records.

The key updates that can be made to associated PMs through the Master PM application include:

? Frequency and Scheduling Information - The Master PM can dictate the time- or

meter-based frequency at which work orders are generated, and apply this to all associated PMs (or selectively if desired)

? Job Plans and Sequence - Users can specify job plans on a sequential basis, which helps in scheduling varied levels of maintenance activities. Changes to the job plan sequence in the Master PM can be propagated to all associated PMs

? Seasonal Dates - Active dates or seasonal adjustments to maintenance activities can be set up within the Master PM, and these adjustments can be transferred to associated PMs as necessary

? PM Hierarchy - The Master PM application allows users to configure and manage PM hierarchies, which helps in establishing parent-child relationships among PM

records. This hierarchical structure is especially useful in organizing maintenance tasks for complex assets with interrelated components, ensuring that all relevant maintenance tasks are triggered appropriately

Thus, option D (PM Hierarchy) correctly represents the feature that can be updated in the Master PM application for associated PM records.

ministrator,Object%20parameter%20and%20Asset%20parameter%20set%20to%20SR.
In IBM Maximo Manage v8.0, Service Request Categories for the Service Request Work Center can be created in the Administration Work Center and through the Classifications Application:
? Administration Work Center: The Service Request Configuration section within the
Administration Work Center enables administrators to set up and customize service request categories specifically for use in the Service Request Work Center. This involves defining properties, categories, and issues users select when creating service requests
? Classifications Application: Categories are also managed by setting up
classifications associated with service requests in the Classifications application. When a classification is created with associations to the "Asset" and "SR" (Service Request) objects, it becomes available as a category option in the Service Request tool. This approach allows issues to be assigned to specific categories using ticket templates tied to classifications
These configurations provide a structured way to set up service categories that enhance service request management by ensuring users select relevant, predefined options during request creation.
